Package 'sits'

February 13, 2025

Type Package

Version 1.5.2

Title Satellite Image Time Series Analysis for Earth Observation Data Cubes

Maintainer Gilberto Camara <gilberto.camara.inpe@gmail.com>

Description An end-to-end toolkit for land use and land cover classification using big Earth observation data. Builds satellite image data cubes from cloud collections. Supports visualization methods for images and time series and smoothing filters for dealing with noisy time series. Includes functions for quality assessment of training samples using self-organized maps and to reduce training samples imbalance. Provides machine learning algorithms including support vector machines, random forests, extreme gradient boosting, multi-layer perceptrons, temporal convolution neural networks, and temporal attention encoders. Performs efficient classification of big Earth observation data cubes and includes functions for post-classification smoothing based on Bayesian inference. Enables best practices for estimating area and assessing accuracy of land change. Minimum recommended requirements: 16 GB RAM and 4 CPU dual-core.

`sits-package` *sits*

Description

Satellite Image Time Series Analysis for Earth Observation Data Cubes

Purpose

The SITS package provides a set of tools for analysis, visualization and classification of satellite image time series. It includes methods for filtering, clustering, classification, and post-processing.

`cerrado_2classes` *Samples of classes Cerrado and Pasture*

Description

A dataset containing a tibble with time series samples for the Cerrado and Pasture areas of the Mato Grosso state. The time series come from MOD13Q1 collection 5 images.

Usage

```
data(cerrado_2classes)
```

Format

A tibble with 736 rows and 7 variables: longitude: East-west coordinate of the time series sample (WGS 84), latitude (North-south coordinate of the time series sample in WGS 84), start_date (initial date of the time series), end_date (final date of the time series), label (the class label associated to the sample), cube (the name of the cube associated with the data), time_series (list containing a tibble with the values of the time series).

`hist.probs_cube` *histogram of prob cubes*

Description

This is a generic function. Parameters depend on the specific type of input.

Usage

```
## S3 method for class 'probs_cube'
hist(x, ..., tile = x[["tile"]][[1]], label = NULL, size = 1e+05)
```

Arguments

`x`	Object of classes "raster_cube".
`...`	Further specifications for summary.
`tile`	Tile to be shown
`label`	Label to be shown
`size`	Number of cells to be sampled

Value

A histogram of one label of a probability cube.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    modis_cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
    probs_cube <- sits_classify(
        data = modis_cube,
        ml_model = rfor_model,
        output_dir = tempdir()
    )
    hist(probs_cube, label = "Forest")
}
```

`hist.raster_cube` *histogram of data cubes*

Description

This is a generic function. Parameters depend on the specific type of input.

Usage

```
## S3 method for class 'raster_cube'
hist(x, ..., tile = x[["tile"]][[1]], date = NULL, band = NULL, size = 10000)
```

Arguments

`x`	Object of classes "raster_cube".
`...`	Further specifications for summary.
`tile`	Tile to be shown
`date`	Date to be shown
`band`	Band to be shown
`size`	Number of cells to be sampled

Value

A histogram of one band of data cube.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    hist(cube)
}
```

hist.sits *Histogram*

Description

This is a generic function. Parameters depend on the specific type of input.

Usage

```
## S3 method for class 'sits'
hist(x, ...)
```

Arguments

x	Object of classes "sits".
...	Further specifications for hist.

Value

A summary of the sits tibble.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    hist(samples_modis_ndvi)
}
```

hist.uncertainty_cube *Histogram uncertainty cubes*

Description

This is a generic function. Parameters depend on the specific type of input.

Usage

```
## S3 method for class 'uncertainty_cube'
hist(x, ..., tile = x[["tile"]][[1]], size = 1e+05)
```

Arguments

x	Object of class "variance_cube"
...	Further specifications for hist.
tile	Tile to be summarized
size	Sample size

Value

A histogram of a uncertainty cube

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # create a random forest model
    rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
    # classify a data cube
    probs_cube <- sits_classify(
        data = cube, ml_model = rfor_model, output_dir = tempdir()
    )
    uncert_cube <- sits_uncertainty(
        cube = probs_cube,
        output_dir = tempdir()
    )
    hist(uncert_cube)
}
```

---

impute_linear *Replace NA values by linear interpolation*

Description

Remove NA by linear interpolation

Usage

```
impute_linear(data = NULL)
```

Arguments

data	A time series vector or matrix

Value

A set of filtered time series using the imputation function.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

---

plot *Plot time series*

Description

This is a generic function. Parameters depend on the specific type of input. See each function description for the required parameters.

- sits tibble: see plot.sits
- patterns: see plot.patterns
- classified time series: see plot.predicted
- raster cube: see plot.raster_cube
- SAR cube: see plot.sar_cube
- DEM cube: see plot.dem_cube
- vector cube: see plot.vector_cube
- classification probabilities: see plot.probs_cube
- classification uncertainty: see plot.uncertainty_cube
- uncertainty of vector cubes: see plot.uncertainty_vector_cube
- classified cube: see plot.class_cube
- classified vector cube: see plot.class_vector_cube
- dendrogram cluster: see plot.sits_cluster
- SOM map: see plot.som_map
- SOM evaluate cluster: see plot.som_evaluate_cluster
- geo-distances: see plot.geo_distances
- random forest model: see plot.rfor_model
- xgboost model: see plot.xgb_model
- torch ML model: see plot.torch_model

Usage

```
## S3 method for class 'sits'
plot(x, y, ..., together = FALSE)
```

Arguments

x	Object of class "sits".
y	Ignored.
...	Further specifications for plot.
together	A logical value indicating whether the samples should be plotted together.

Value

A series of plot objects produced by ggplot2 showing all time series associated to each combination of band and label, and including the median, and first and third quartile ranges.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # plot sets of time series
    plot(cerrado_2classes)
}
```

---

plot.class_cube *Plot classified images*

Description

plots a classified raster using ggplot.

Usage

```
## S3 method for class 'class_cube'
plot(
  x,
  y,
  ...,
  tile = x[["tile"]][[1]],
  roi = NULL,
  title = "Classified Image",
  legend = NULL,
  palette = "Spectral",
  scale = 1,
  max_cog_size = 1024,
  legend_position = "inside"
)
```

Arguments

x	Object of class "class_cube".
y	Ignored.
...	Further specifications for plot.
tile	Tile to be plotted.
roi	Spatial extent to plot in WGS 84 - named vector with either (lon_min, lon_max, lat_min, lat_max) or (xmin, xmax, ymin, ymax)
title	Title of the plot.
legend	Named vector that associates labels to colors.
palette	Alternative RColorBrewer palette
scale	Relative scale (0.4 to 1.0) of plot text
max_cog_size	Maximum size of COG overviews (lines or columns)
legend_position	Where to place the legend (default = "outside")

Value

A color map, where each pixel has the color associated to a label, as defined by the legend parameter.

Note

The following optional parameters are available to allow for detailed control over the plot output:

- graticules_labels_size: size of coordinates labels (default = 0.8)
- legend_title_size: relative size of legend title (default = 1.0)
- legend_text_size: relative size of legend text (default = 1.0)
- legend_bg_color: color of legend background (default = "white")
- legend_bg_alpha: legend opacity (default = 0.5)

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # create a random forest model
    rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
    # create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # classify a data cube
```

```
    probs_cube <- sits_classify(
        data = cube, ml_model = rfor_model, output_dir = tempdir()
    )
    # label cube with the most likely class
    label_cube <- sits_label_classification(
        probs_cube,
        output_dir = tempdir()
    )
    # plot the resulting classified image
    plot(label_cube)
}
```

`plot.class_vector_cube` *Plot Segments*

Description

Plot vector classified cube

Usage

```
## S3 method for class 'class_vector_cube'
plot(
  x,
  ...,
  tile = x[["tile"]][[1]],
  legend = NULL,
  seg_color = "black",
  line_width = 0.5,
  palette = "Spectral",
  scale = 1,
  legend_position = "inside"
)
```

Arguments

`x`	Object of class "segments".
`...`	Further specifications for plot.
`tile`	Tile to be plotted.
`legend`	Named vector that associates labels to colors.
`seg_color`	Segment color.
`line_width`	Segment line width.
`palette`	Alternative RColorBrewer palette
`scale`	Scale to plot map (0.4 to 1.0)
`legend_position`	Where to place the legend (default = "outside")

Value

A plot object with an RGB image or a B/W image on a color scale using the chosen palette

Note

To see which color palettes are supported, please run

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # segment the image
    segments <- sits_segment(
        cube = cube,
        output_dir = tempdir()
    )
    # create a classification model
    rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
    # classify the segments
    probs_segs <- sits_classify(
        data = segments,
        ml_model = rfor_model,
        output_dir = tempdir()
    )
    #
    # Create a classified vector cube
    class_segs <- sits_label_classification(
        cube = probs_segs,
        output_dir = tempdir(),
        multicores = 2,
        memsize = 4
    )
    # plot the segments
    plot(class_segs)
}
```

`plot.dem_cube` *Plot DEM cubes*

Description

Plot RGB raster cube

Usage

```
## S3 method for class 'dem_cube'
plot(
  x,
  ...,
  band = "ELEVATION",
  tile = x[["tile"]][[1]],
  roi = NULL,
  palette = "Spectral",
  rev = TRUE,
  scale = 1,
  max_cog_size = 1024,
  legend_position = "inside"
)
```

Arguments

x	Object of class "dem_cube".
...	Further specifications for plot.
band	Band for plotting grey images.
tile	Tile to be plotted.
roi	Spatial extent to plot in WGS 84 - named vector with either (lon_min, lon_max, lat_min, lat_max) or (xmin, xmax, ymin, ymax)
palette	An RColorBrewer palette
rev	Reverse the color order in the palette?
scale	Scale to plot map (0.4 to 1.0)
max_cog_size	Maximum size of COG overviews (lines or columns)
legend_position	Where to place the legend (default = "inside")

Value

A plot object with a DEM cube or a B/W image on a color scale

Note

Use `scale` parameter for general output control.

The following optional parameters are available to allow for detailed control over the plot output:

- `graticules_labels_size`: size of coordinates labels (default = 0.7)
- `legend_title_size`: relative size of legend title (default = 0.7)
- `legend_text_size`: relative size of legend text (default = 0.7)

- legend_bg_color: color of legend background (default = "white")
- legend_bg_alpha: legend opacity (default = 0.3)

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
# obtain the DEM cube
    dem_cube_19HBA <- sits_cube(
        source = "MPC",
        collection = "COP-DEM-GLO-30",
        bands = "ELEVATION",
        tiles = "19HBA"
        )
# plot the DEM reversing the palette
    plot(dem_cube_19HBA, band = "ELEVATION")
}
```

---

plot.geo_distances *Make a kernel density plot of samples distances.*

Description

Make a kernel density plot of samples distances.

Usage

```
## S3 method for class 'geo_distances'
plot(x, y, ...)
```

Arguments

x	Object of class "geo_distances".
y	Ignored.
...	Further specifications for plot.

Value

A plot showing the sample-to-sample distances and sample-to-prediction distances.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Examples

```
if (sits_run_examples()) {
    # read a shapefile for the state of Mato Grosso, Brazil
    mt_shp <- system.file("extdata/shapefiles/mato_grosso/mt.shp",
        package = "sits"
    )
    # convert to an sf object
    mt_sf <- sf::read_sf(mt_shp)
    # calculate sample-to-sample and sample-to-prediction distances
    distances <- sits_geo_dist(samples_modis_ndvi, mt_sf)
    # plot sample-to-sample and sample-to-prediction distances
    plot(distances)
}
```

---

plot.patterns *Plot patterns that describe classes*

Description

Plots the patterns to be used for classification

Given a sits tibble with a set of patterns, plot them.

Usage

```
## S3 method for class 'patterns'
plot(x, y, ..., bands = NULL, year_grid = FALSE)
```

Arguments

x	Object of class "patterns".
y	Ignored.
...	Further specifications for plot.
bands	Bands to be viewed (optional).
year_grid	Plot a grid of panels using labels as columns and years as rows. Default is FALSE.

Value

A plot object produced by ggplot2 with one average pattern per label.

Note

This code is reused from the dtwSat package by Victor Maus.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Victor Maus, <vwmaus1@gmail.com>

Examples

```
if (sits_run_examples()) {
    # plot patterns
    plot(sits_patterns(cerrado_2classes))
}
```

`plot.predicted` *Plot time series predictions*

Description

Given a sits tibble with a set of predictions, plot them

Usage

```
## S3 method for class 'predicted'
plot(x, y, ..., bands = "NDVI", palette = "Harmonic")
```

Arguments

`x`	Object of class "predicted".
`y`	Ignored.
`...`	Further specifications for plot.
`bands`	Bands for visualization.
`palette`	HCL palette used for visualization in case classes are not in the default sits palette.

Value

A plot object produced by ggplot2 showing the time series and its label.

Note

This code is reused from the dtwSat package by Victor Maus.

Author(s)

Victor Maus, <vwmaus1@gmail.com>

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # Retrieve the samples for Mato Grosso
    # train an svm model
    ml_model <- sits_train(samples_modis_ndvi, ml_method = sits_svm)
    # classify the point
    point_ndvi <- sits_select(point_mt_6bands, bands = "NDVI")
    point_class <- sits_classify(
        data = point_ndvi, ml_model = ml_model
    )
    plot(point_class)
}
```

---

plot.probs_cube *Plot probability cubes*

Description

plots a probability cube

Usage

```
## S3 method for class 'probs_cube'
plot(
  x,
  ...,
  tile = x[["tile"]][[1]],
  roi = NULL,
  labels = NULL,
  palette = "YlGn",
  rev = FALSE,
  quantile = NULL,
  scale = 1,
  max_cog_size = 512,
  legend_position = "outside",
  legend_title = "probs"
)
```

Arguments

x	Object of class "probs_cube".
...	Further specifications for plot.

tile	Tile to be plotted.
roi	Spatial extent to plot in WGS 84 - named vector with either (lon_min, lon_max, lat_min, lat_max) or (xmin, xmax, ymin, ymax)
labels	Labels to plot.
palette	RColorBrewer palette
rev	Reverse order of colors in palette?
quantile	Minimum quantile to plot
scale	Scale to plot map (0.4 to 1.0)
max_cog_size	Maximum size of COG overviews (lines or columns)
legend_position	Where to place the legend (default = "outside")
legend_title	Title of legend (default = "probs")

Value

A plot containing probabilities associated to each class for each pixel.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # create a random forest model
    rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
    # create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # classify a data cube
    probs_cube <- sits_classify(
        data = cube, ml_model = rfor_model, output_dir = tempdir()
    )
    # plot the resulting probability cube
    plot(probs_cube)
}
```

plot.probs_vector_cube *Plot probability vector cubes*

Description

plots a probability cube

Usage

```
## S3 method for class 'probs_vector_cube'
plot(
  x,
  ...,
  tile = x[["tile"]][[1]],
  labels = NULL,
  palette = "YlGn",
  rev = FALSE,
  scale = 1,
  legend_position = "outside"
)
```

Arguments

x	Object of class "probs_vector_cube".
...	Further specifications for plot.
tile	Tile to be plotted.
labels	Labels to plot
palette	RColorBrewer palette
rev	Reverse order of colors in palette?
scale	Scale to plot map (0.4 to 1.0)
legend_position	Where to place the legend (default = "outside")

Value

A plot containing probabilities associated to each class for each pixel.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # create a random forest model
    rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
    # create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # segment the image
    segments <- sits_segment(
        cube = cube,
        seg_fn = sits_slic(step = 5,
                           compactness = 1,
                           dist_fun = "euclidean",
                           avg_fun = "median",
                           iter = 20,
                           minarea = 10,
                           verbose = FALSE),
        output_dir = tempdir()
    )
    # classify a data cube
    probs_vector_cube <- sits_classify(
        data = segments,
        ml_model = rfor_model,
        output_dir = tempdir()
    )
    # plot the resulting probability cube
    plot(probs_vector_cube, labels = "Forest")
}
```

---

plot.raster_cube *Plot RGB data cubes*

Description

Plot RGB raster cube

Usage

```
## S3 method for class 'raster_cube'
plot(
  x,
  ...,
  band = NULL,
  red = NULL,
```

```
  green = NULL,
  blue = NULL,
  tile = x[["tile"]][[1]],
  dates = NULL,
  roi = NULL,
  palette = "RdYlGn",
  rev = FALSE,
  scale = 1,
  first_quantile = 0.02,
  last_quantile = 0.98,
  max_cog_size = 1024,
  legend_position = "inside"
)
```

Arguments

x	Object of class "raster_cube".
...	Further specifications for plot.
band	Band for plotting grey images.
red	Band for red color.
green	Band for green color.
blue	Band for blue color.
tile	Tile to be plotted.
dates	Dates to be plotted
roi	Spatial extent to plot in WGS 84 - named vector with either (lon_min, lon_max, lat_min, lat_max) or (xmin, xmax, ymin, ymax)
palette	An RColorBrewer palette
rev	Reverse the color order in the palette?
scale	Scale to plot map (0.4 to 1.0)
first_quantile	First quantile for stretching images
last_quantile	Last quantile for stretching images
max_cog_size	Maximum size of COG overviews (lines or columns)
legend_position	Where to place the legend (default = "outside")

Value

A plot object with an RGB image or a B/W image on a color scale

Note

Use scale parameter for general output control. The dates parameter indicates the date allows plotting of different dates when a single band and three dates are provided, ‘sits‘ will plot a multi-temporal RGB image for a single band (useful in the case of SAR data). For RGB bands with multi-dates, multiple plots will be produced.

The following optional parameters are available to allow for detailed control over the plot output:

- graticules_labels_size: size of coordinates labels (default = 0.7)
- legend_title_size: relative size of legend title (default = 0.7)
- legend_text_size: relative size of legend text (default = 0.7)
- legend_bg_color: color of legend background (default = "white")
- legend_bg_alpha: legend opacity (default = 0.3)

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # plot NDVI band of the second date date of the data cube
    plot(cube, band = "NDVI", dates = sits_timeline(cube)[1])
}
```

---

plot.rfor_model *Plot Random Forest model*

Description

Plots the important variables in a random forest model.

Usage

```
## S3 method for class 'rfor_model'
plot(x, y, ...)
```

Arguments

x	Object of class "rf_model".
y	Ignored.
...	Further specifications for plot.

Value

A random forest object.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # Retrieve the samples for Mato Grosso
    # train a random forest model
    rf_model <- sits_train(samples_modis_ndvi, ml_method = sits_rfor())
    # plot the model
    plot(rf_model)
}
```

---

plot.sar_cube *Plot SAR data cubes*

Description

Plot SAR raster cube

Usage

```
## S3 method for class 'sar_cube'
plot(
  x,
  ...,
  band = NULL,
  red = NULL,
  green = NULL,
  blue = NULL,
  tile = x[["tile"]][[1]],
  dates = NULL,
  roi = NULL,
  palette = "Greys",
  rev = FALSE,
  scale = 1,
  first_quantile = 0.05,
  last_quantile = 0.95,
  max_cog_size = 1024,
  legend_position = "inside"
)
```

Arguments

x	Object of class "raster_cube".
...	Further specifications for plot.
band	Band for plotting grey images.
red	Band for red color.
green	Band for green color.
blue	Band for blue color.
tile	Tile to be plotted.
dates	Dates to be plotted.
roi	Spatial extent to plot in WGS 84 - named vector with either (lon_min, lon_max, lat_min, lat_max) or (xmin, xmax, ymin, ymax)
palette	An RColorBrewer palette
rev	Reverse the color order in the palette?
scale	Scale to plot map (0.4 to 1.0)
first_quantile	First quantile for stretching images
last_quantile	Last quantile for stretching images
max_cog_size	Maximum size of COG overviews (lines or columns)
legend_position	Where to place the legend (default = "inside")

Value

A plot object with an RGB image or a B/W image on a color scale for SAR cubes

Note

Use `scale` parameter for general output control. The `dates` parameter indicates the date allows plotting of different dates when a single band and three dates are provided, 'sits' will plot a multi-temporal RGB image for a single band (useful in the case of SAR data). For RGB bands with multi-dates, multiple plots will be produced.

The following optional parameters are available to allow for detailed control over the plot output:

- `graticules_labels_size`: size of coordinates labels (default = 0.7)
- `legend_title_size`: relative size of legend title (default = 0.7)
- `legend_text_size`: relative size of legend text (default = 0.7)
- `legend_bg_color`: color of legend background (default = "white")
- `legend_bg_alpha`: legend opacity (default = 0.3)

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # create a SAR data cube from cloud services
    cube_s1_grd <-  sits_cube(
        source = "MPC",
        collection = "SENTINEL-1-GRD",
        bands = c("VV", "VH"),
        orbit = "descending",
        tiles = c("21LUJ"),
        start_date = "2021-08-01",
        end_date = "2021-09-30"
    )
    # plot VH band of the first date of the data cube
    plot(cube_s1_grd, band = "VH")
}
```

---

plot.sits_accuracy *Plot confusion matrix*

Description

Plot a bar graph with informations about the confusion matrix

Usage

```
## S3 method for class 'sits_accuracy'
plot(x, y, ..., title = "Confusion matrix")
```

Arguments

x	Object of class "plot.sits_accuracy".
y	Ignored.
...	Further specifications for plot.
title	Title of plot.

Value

A plot object produced by the ggplot2 package containing color bars showing the confusion between classes.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Gilberto Camara <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # show accuracy for a set of samples
    train_data <- sits_sample(samples_modis_ndvi, frac = 0.5)
    test_data  <- sits_sample(samples_modis_ndvi, frac = 0.5)
    # compute a random forest model
    rfor_model <- sits_train(train_data, sits_rfor())
    # classify training points
    points_class <- sits_classify(
        data = test_data, ml_model = rfor_model
    )
    # calculate accuracy
    acc <- sits_accuracy(points_class)
    # plot accuracy
    plot(acc)
}
```

`plot.sits_cluster` *Plot a dendrogram cluster*

Description

Plot a dendrogram

Usage

```
## S3 method for class 'sits_cluster'
plot(x, ..., cluster, cutree_height, palette)
```

Arguments

`x`	sits tibble with cluster indexes.
`...`	Further specifications for plot.
`cluster`	cluster object produced by ‘sits_cluster‘ function.
`cutree_height`	dashed horizontal line to be drawn indicating the height of dendrogram cutting.
`palette`	HCL color palette.

Value

The dendrogram object.

Author(s)

Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
if (sits_run_examples()) {
     samples <- sits_cluster_dendro(cerrado_2classes,
                bands = c("NDVI", "EVI"))
}
```

`plot.som_clean_samples` *Plot SOM samples evaluated*

Description

It is useful to visualise the output of the SOM evaluation, which classifies the samples as "clean" (good samples), "remove" (possible outliers), and "analyse" (borderline cases). This function plots the percentual distribution of the SOM evaluation per class. To use it, please run `sits_som_clean_samples` using the parameter "keep" as "c("clean", "analyze", "remove").

Usage

```
## S3 method for class 'som_clean_samples'
plot(x, ...)
```

Arguments

`x`	Object of class "som_clean_samples".
`...`	Further specifications for plot.

Value

Called for side effects.

Author(s)

Estefania Pizarro, <eapizarroa@ine.gob.cl>

Examples

```
if (sits_run_examples()) {
    # create a SOM map
    som_map <- sits_som_map(samples_modis_ndvi)
    # plot the SOM map
    eval <- sits_som_clean_samples(som_map)
    plot(eval)
}
```

`plot.som_evaluate_cluster` *Plot confusion between clusters*

Description

Plot a bar graph with informations about each cluster. The percentage of mixture between the clusters.

Usage

```
## S3 method for class 'som_evaluate_cluster'
plot(x, y, ..., name_cluster = NULL, title = "Confusion by cluster")
```

Arguments

`x`	Object of class "plot.som_evaluate_cluster".
`y`	Ignored.
`...`	Further specifications for plot.
`name_cluster`	Choose the cluster to plot.
`title`	Title of plot.

Value

A plot object produced by the ggplot2 package containing color bars showing the confusion between classes.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Lorena Santos <lorena.santos@inpe.br>

Examples

```
if (sits_run_examples()) {
    # create a SOM map
    som_map <- sits_som_map(samples_modis_ndvi)
    # evaluate the SOM cluster
    som_clusters <- sits_som_evaluate_cluster(som_map)
    # plot the SOM cluster evaluation
    plot(som_clusters)
}
```

plot.som_map *Plot a SOM map*

Description

plots a SOM map generated by "sits_som_map". The plot function produces different plots based on the input data. If type is "codes", plots the vector weight for in each neuron. If type is "mapping", shows where samples are mapped.

Usage

```
## S3 method for class 'som_map'
plot(x, y, ..., type = "codes", band = 1)
```

Arguments

x	Object of class "som_map".
y	Ignored.
...	Further specifications for plot.
type	Type of plot: "codes" for neuron weight (time series) and "mapping" for the number of samples allocated in a neuron.
band	What band will be plotted.

Value

Called for side effects.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # create a SOM map
    som_map <- sits_som_map(samples_modis_ndvi)
    # plot the SOM map
    plot(som_map)
}
```

`plot.torch_model` *Plot Torch (deep learning) model*

Description

Plots a deep learning model developed using torch.

Usage

```
## S3 method for class 'torch_model'
plot(x, y, ...)
```

Arguments

`x`	Object of class "torch_model".
`y`	Ignored.
`...`	Further specifications for plot.

Value

A plot object produced by the ggplot2 package showing the evolution of the loss and accuracy of the model.

Note

This code has been lifted from the "keras" package.

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Felipe Souza, <lipecaso@gmail.com>

Rolf Simoes, <rolf.simoes@inpe.br>

Alber Sanchez, <alber.ipia@inpe.br>

Examples

```
if (sits_run_examples()) {
    # Retrieve the samples for Mato Grosso
    # train a tempCNN model
    ml_model <- sits_train(samples_modis_ndvi, ml_method = sits_tempcnn)
    # plot the model
    plot(ml_model)
}
```

`plot.uncertainty_cube` *Plot uncertainty cubes*

Description

plots a uncertainty cube

Usage

```
## S3 method for class 'uncertainty_cube'
plot(
  x,
  ...,
  tile = x[["tile"]][[1]],
  roi = NULL,
  palette = "RdYlGn",
  rev = TRUE,
  scale = 1,
  first_quantile = 0.02,
  last_quantile = 0.98,
  max_cog_size = 1024,
  legend_position = "inside"
)
```

Arguments

`x`	Object of class "probs_image".
`...`	Further specifications for plot.
`tile`	Tiles to be plotted.
`roi`	Spatial extent to plot in WGS 84 - named vector with either (lon_min, lon_max, lat_min, lat_max) or (xmin, xmax, ymin, ymax)
`palette`	An RColorBrewer palette
`rev`	Reverse the color order in the palette?
`scale`	Scale to plot map (0.4 to 1.0)
`first_quantile`	First quantile for stretching images
`last_quantile`	Last quantile for stretching images
`max_cog_size`	Maximum size of COG overviews (lines or columns)
`legend_position`	Where to place the legend (default = "inside")

Value

A plot object produced showing the uncertainty associated to each classified pixel.

Note

The following optional parameters are available to allow for detailed control over the plot output:

- `graticules_labels_size`: size of coordinates labels (default = 0.7)
- `legend_title_size`: relative size of legend title (default = 1.0)
- `legend_text_size`: relative size of legend text (default = 1.0)
- `legend_bg_color`: color of legend background (default = "white")
- `legend_bg_alpha`: legend opacity (default = 0.5)

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # create a random forest model
    rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
    # create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # classify a data cube
    probs_cube <- sits_classify(
        data = cube, ml_model = rfor_model, output_dir = tempdir()
    )
    # calculate uncertainty
    uncert_cube <- sits_uncertainty(probs_cube, output_dir = tempdir())
    # plot the resulting uncertainty cube
    plot(uncert_cube)
}
```

---

plot.uncertainty_vector_cube

Plot uncertainty vector cubes

Description

plots a probability cube using stars

Usage

```
## S3 method for class 'uncertainty_vector_cube'
plot(
  x,
  ...,
  tile = x[["tile"]][[1]],
  palette = "RdYlGn",
  rev = TRUE,
  scale = 1,
  legend_position = "inside"
)
```

Arguments

x	Object of class "probs_vector_cube".
...	Further specifications for plot.
tile	Tile to be plotted.
palette	RColorBrewer palette
rev	Reverse order of colors in palette?
scale	Scale to plot map (0.4 to 1.0)
legend_position	Where to place the legend (default = "inside")

Value

A plot containing probabilities associated to each class for each pixel.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # create a random forest model
    rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
    # create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # segment the image
    segments <- sits_segment(
        cube = cube,
        seg_fn = sits_slic(step = 5,
                           compactness = 1,
```

```
                            dist_fun = "euclidean",
                            avg_fun = "median",
                            iter = 20,
                            minarea = 10,
                            verbose = FALSE),
        output_dir = tempdir()
    )
    # classify a data cube
    probs_vector_cube <- sits_classify(
        data = segments,
        ml_model = rfor_model,
        output_dir = tempdir()
    )
    # measure uncertainty
    uncert_vector_cube <- sits_uncertainty(
        cube = probs_vector_cube,
        type = "margin",
        output_dir = tempdir()
    )
    # plot the resulting uncertainty cube
    plot(uncert_vector_cube)
}
```

`plot.variance_cube` *Plot variance cubes*

Description

plots a variance cube

Usage

```
## S3 method for class 'variance_cube'
plot(
  x,
  ...,
  tile = x[["tile"]][[1]],
  roi = NULL,
  labels = NULL,
  palette = "YlGnBu",
  rev = FALSE,
  type = "map",
  quantile = 0.75,
  scale = 1,
  max_cog_size = 1024,
  legend_position = "inside",
  legend_title = "logvar"
)
```

Arguments

x	Object of class "variance_cube".
...	Further specifications for plot.
tile	Tile to be plotted.
roi	Spatial extent to plot in WGS 84 - named vector with either (lon_min, lon_max, lat_min, lat_max) or (xmin, xmax, ymin, ymax)
labels	Labels to plot.
palette	RColorBrewer palette
rev	Reverse order of colors in palette?
type	Type of plot ("map" or "hist")
quantile	Minimum quantile to plot
scale	Scale to plot map (0.4 to 1.0)
max_cog_size	Maximum size of COG overviews (lines or columns)
legend_position	Where to place the legend (default = "inside")
legend_title	Title of legend (default = "probs")

Value

A plot containing local variances associated to the logit probability for each pixel and each class.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # create a random forest model
    rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
    # create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # classify a data cube
    probs_cube <- sits_classify(
        data = cube, ml_model = rfor_model, output_dir = tempdir()
    )
    # obtain a variance cube
    var_cube <- sits_variance(probs_cube, output_dir = tempdir())
    # plot the variance cube
    plot(var_cube)
}
```

`plot.vector_cube` *Plot RGB vector data cubes*

Description

Plot RGB raster cube

Usage

```
## S3 method for class 'vector_cube'
plot(
  x,
  ...,
  band = NULL,
  red = NULL,
  green = NULL,
  blue = NULL,
  tile = x[["tile"]][[1]],
  dates = NULL,
  seg_color = "yellow",
  line_width = 0.3,
  palette = "RdYlGn",
  rev = FALSE,
  scale = 1,
  first_quantile = 0.02,
  last_quantile = 0.98,
  max_cog_size = 1024,
  legend_position = "inside"
)
```

Arguments

`x`	Object of class "raster_cube".
`...`	Further specifications for plot.
`band`	Band for plotting grey images.
`red`	Band for red color.
`green`	Band for green color.
`blue`	Band for blue color.
`tile`	Tile to be plotted.
`dates`	Dates to be plotted.
`seg_color`	Color to show the segment boundaries
`line_width`	Line width to plot the segments boundary (in pixels)
`palette`	An RColorBrewer palette
`rev`	Reverse the color order in the palette?

scale	Scale to plot map (0.4 to 1.5)
first_quantile	First quantile for stretching images
last_quantile	Last quantile for stretching images
max_cog_size	Maximum size of COG overviews (lines or columns)
legend_position	Where to place the legend (default = "inside")

Value

A plot object with an RGB image or a B/W image on a color scale using the palette

Note

The following optional parameters are available to allow for detailed control over the plot output:

- graticules_labels_size: size of coordinates labels (default = 0.7)
- legend_title_size: relative size of legend title (default = 0.7)
- legend_text_size: relative size of legend text (default = 0.7)
- legend_bg_color: color of legend background (default = "white")
- legend_bg_alpha: legend opacity (default = 0.3)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # Segment the cube
    segments <- sits_segment(
        cube = cube,
        output_dir = tempdir(),
        multicores = 2,
        memsize = 4
    )
    # plot NDVI band of the second date date of the data cube
    plot(segments, band = "NDVI", date = sits_timeline(cube)[1])
}
```

`plot.xgb_model` *Plot XGB model*

Description

Plots trees in an extreme gradient boosting model.

Usage

```
## S3 method for class 'xgb_model'
plot(x, ..., trees = 0:4, width = 1500, height = 1900)
```

Arguments

`x`	Object of class "xgb_model".
`...`	Further specifications for plot.
`trees`	Vector of trees to be plotted
`width`	Width of the output window
`height`	Height of the output window

Value

A plot

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # Retrieve the samples for Mato Grosso
    # train an extreme gradient boosting
    xgb_model <- sits_train(samples_modis_ndvi,
        ml_method = sits_xgboost()
    )
    plot(xgb_model)
}
```

point_mt_6bands *A time series sample with data from 2000 to 2016*

Description

A dataset containing a tibble with one time series samples in the Mato Grosso state of Brazil. The time series comes from MOD13Q1 collection 6 images.

Usage

```
data(point_mt_6bands)
```

Format

A tibble with 1 rows and 7 variables: longitude: East-west coordinate of the time series sample (WGS 84), latitude (North-south coordinate of the time series sample in WGS 84), start_date (initial date of the time series), end_date (final date of the time series), label (the class label associated to the sample), cube (the name of the cube associated with the data), time_series (list containing a tibble with the values of the time series).

samples_l8_rondonia_2bands *Samples of Amazon tropical forest biome for deforestation analysis*

Description

A sits tibble with time series samples from Brazilian Amazonia rain forest.

The labels are: "Deforestation", "Forest", "NatNonForest" and "Pasture".

The time series were extracted from the Landsat-8 BDC data cube (collection = "LC8_30_16D_STK-1", tiles = "038047"). These time series comprehends a period of 12 months (25 observations) from "2018-07-12" to "2019-07-28". The extracted bands are NDVI and EVI. Cloudy values were removed and interpolated.

Usage

```
data("samples_l8_rondonia_2bands")
```

Format

A `sits` tibble with 160 samples.

samples_modis_ndvi *Samples of nine classes for the state of Mato Grosso*

Description

A dataset containing a tibble with time series samples for the Mato Grosso state in Brasil. The time series come from MOD13Q1 collection 6 images. The data set has the following classes: Cerrado(379 samples), Forest (131 samples), Pasture (344 samples), and Soy_Corn (364 samples).

Usage

```
data(samples_modis_ndvi)
```

Format

A tibble with 1308 rows and 7 variables: longitude: East-west coordinate of the time series sample (WGS 84), latitude (North-south coordinate of the time series sample in WGS 84), start_date (initial date of the time series), end_date (final date of the time series), label (the class label associated to the sample), cube (the name of the cube associated with the data), time_series (list containing a tibble with the values of the time series).

sits_accuracy *Assess classification accuracy (area-weighted method)*

Description

This function calculates the accuracy of the classification result. For a set of time series, it creates a confusion matrix and then calculates the resulting statistics using package `caret`. The time series needs to be classified using `sits_classify`.

Classified images are generated using `sits_classify` followed by `sits_label_classification`. For a classified image, the function uses an area-weighted technique proposed by Olofsson et al. according to [1-3] to produce more reliable accuracy estimates at 95

In both cases, it provides an accuracy assessment of the classified, including Overall Accuracy, Kappa, User's Accuracy, Producer's Accuracy and error matrix (confusion matrix)

Usage

```
sits_accuracy(data, ...)

## S3 method for class 'sits'
sits_accuracy(data, ...)

## S3 method for class 'class_cube'
sits_accuracy(data, ..., validation, method = "olofsson")
```

```
## S3 method for class 'raster_cube'
sits_accuracy(data, ...)

## S3 method for class 'derived_cube'
sits_accuracy(data, ...)

## S3 method for class 'tbl_df'
sits_accuracy(data, ...)

## Default S3 method:
sits_accuracy(data, ...)
```

Arguments

data	Either a data cube with classified images or a set of time series
...	Specific parameters
validation	Samples for validation (see below) Only required when data is a class cube.
method	A character with 'olofsson' or 'pixel' to compute accuracy.

Value

A list of lists: The error_matrix, the class_areas, the unbiased estimated areas, the standard error areas, confidence interval 95 and the accuracy (user, producer, and overall), or NULL if the data is empty. A confusion matrix assessment produced by the caret package.

Note

The 'validation' data needs to contain the following columns: "latitude", "longitude", "start_date", "end_date", and "label". It can be either a path to a CSV file, a sits tibble, a data frame, or an sf object.

When 'validation' is an sf object, the columns "latitude" and "longitude" are not required as the locations are extracted from the geometry column. The 'centroid' is calculated before extracting the location values for any geometry type.

    ground_truth <- system.file("extdata/samples/samples_sinop_crop.csv",
        package = "sits"
    )
    # make accuracy assessment
    as <- sits_accuracy(label_cube, validation = ground_truth)
}
```

---

sits_add_base_cube *Add base maps to a time series data cube*

Description

This function add base maps to time series data cube. Base maps have information that is stable in time (e.g, DEM) which provide relevant information for modelling and classification.

To add a base cube to an existing data cube, they should share the same sensor, resolution, bounding box, timeline, and have different bands.

Usage

```
sits_add_base_cube(cube1, cube2)
```

Arguments

cube1	Data cube (tibble of class "raster_cube") .
cube2	Data cube (tibble of class "dem_cube") .

Value

a merged data cube with the inclusion of a base_info tibble

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
     s2_cube <- sits_cube(
           source = "MPC",
           collection = "SENTINEL-2-L2A",
           tiles = "18HYE",
           bands = c("B8A", "CLOUD"),
           start_date = "2022-01-01",
           end_date = "2022-03-31"
           )
     output_dir <- paste0(tempdir(), "/reg")
     if (!dir.exists(output_dir)) {
               dir.create(output_dir)
     }
     dem_cube <- sits_cube(
           source = "MPC",
           collection = "COP-DEM-GLO-30",
           tiles = "18HYE",
           bands = "ELEVATION"
           )
     s2_reg  <- sits_regularize(
           cube = s2_cube,
           period = "P1M",
           res = 240,
           output_dir = output_dir,
           multicores = 2,
           memsize = 4
     )
     dem_reg  <- sits_regularize(
           cube = dem_cube,
           res = 240,
           tiles = "18HYE",
           output_dir = output_dir,
           multicores = 2,
```

```
        memsize = 4
    )
    s2_reg <- sits_add_base_cube(s2_reg, dem_reg)
}
```

`sits_apply` *Apply a function on a set of time series*

Description

Apply a named expression to a sits cube or a sits tibble to be evaluated and generate new bands (indices). In the case of sits cubes, it materializes a new band in `output_dir` using `gdalcubes`.

Usage

```
sits_apply(data, ...)

## S3 method for class 'sits'
sits_apply(data, ...)

## S3 method for class 'raster_cube'
sits_apply(
  data,
  ...,
  window_size = 3L,
  memsize = 4L,
  multicores = 2L,
  normalized = TRUE,
  output_dir,
  progress = FALSE
)

## S3 method for class 'derived_cube'
sits_apply(data, ...)

## Default S3 method:
sits_apply(data, ...)
```

Arguments

`data`	Valid sits tibble or cube
`...`	Named expressions to be evaluated (see details).
`window_size`	An odd number representing the size of the sliding window of sits kernel functions used in expressions (for a list of supported kernel functions, please see details).
`memsize`	Memory available for classification (in GB).

multicores	Number of cores to be used for classification.
normalized	Produce normalized band?
output_dir	Directory where files will be saved.
progress	Show progress bar?

Details

sits_apply() allow any valid R expression to compute new bands. Use R syntax to pass an expression to this function. Besides arithmetic operators, you can use virtually any R function that can be applied to elements of a matrix (functions that are unaware of matrix sizes, e.g. sqrt(), sin(), log()).

Also, sits_apply() accepts a predefined set of kernel functions (see below) that can be applied to pixels considering its neighborhood. sits_apply() considers a neighborhood of a pixel as a set of pixels equidistant to it (including itself) according the Chebyshev distance. This neighborhood form a square window (also known as kernel) around the central pixel (Moore neighborhood). Users can set the window_size parameter to adjust the size of the kernel window. The image is conceptually mirrored at the edges so that neighborhood including a pixel outside the image is equivalent to take the 'mirrored' pixel inside the edge.

sits_apply() applies a function to the kernel and its result is assigned to a corresponding central pixel on a new matrix. The kernel slides throughout the input image and this process generates an entire new matrix, which is returned as a new band to the cube. The kernel functions ignores any NA values inside the kernel window. Central pixel is NA just only all pixels in the window are NA.

By default, the indexes generated by the sits_apply() function are normalized between -1 and 1, scaled by a factor of 0.0001. Normalized indexes are saved as INT2S (Integer with sign). If the normalized parameter is FALSE, no scaling factor will be applied and the index will be saved as FLT4S (Float with sign).

Value

A sits tibble or a sits cube with new bands, produced according to the requested expression.

Summarizing kernel functions

- w_median(): returns the median of the neighborhood's values.
- w_sum(): returns the sum of the neighborhood's values.
- w_mean(): returns the mean of the neighborhood's values.
- w_sd(): returns the standard deviation of the neighborhood's values.
- w_min(): returns the minimum of the neighborhood's values.
- w_max(): returns the maximum of the neighborhood's values.
- w_var(): returns the variance of the neighborhood's values.
- w_modal(): returns the modal of the neighborhood's values.

        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )

    # Generate a texture images with variance in NDVI images
    cube_texture <- sits_apply(
        data = cube,
        NDVITEXTURE = w_median(NDVI),
        window_size = 5,
        output_dir = tempdir()
    )
}
```

---

sits_as_sf *Return a sits_tibble or raster_cube as an sf object.*

Description

Return a sits_tibble or raster_cube as an sf object.

Usage

```
sits_as_sf(data, ...)

## S3 method for class 'sits'
sits_as_sf(data, ..., crs = "EPSG:4326", as_crs = NULL)

## S3 method for class 'raster_cube'
sits_as_sf(data, ..., as_crs = NULL)
```

Arguments

data	A sits tibble or sits cube.
...	Additional parameters.

crs	Input coordinate reference system.
as_crs	Output coordinate reference system.

Value

An sf object of point or polygon geometry.

Author(s)

Felipe Carvalho, <felipe.carvalho@inpe.br>

Alber Sanchez, <alber.ipia@inpe.br>

Examples

```
if (sits_run_examples()) {
    # convert sits tibble to an sf object (point)
    sf_object <- sits_as_sf(cerrado_2classes)

    # convert sits cube to an sf object (polygon)
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    sf_object <- sits_as_sf(cube)
}
```

---

sits_bands *Get the names of the bands*

Description

Finds the names of the bands of a set of time series or of a data cube

Usage

```
sits_bands(x)

## S3 method for class 'sits'
sits_bands(x)

## S3 method for class 'raster_cube'
sits_bands(x)

## S3 method for class 'patterns'
sits_bands(x)
```

```
## S3 method for class 'sits_model'
sits_bands(x)

## Default S3 method:
sits_bands(x)

sits_bands(x) <- value

## S3 replacement method for class 'sits'
sits_bands(x) <- value

## S3 replacement method for class 'raster_cube'
sits_bands(x) <- value

## Default S3 replacement method:
sits_bands(x) <- value
```

Arguments

x	Valid sits tibble (time series or a cube)
value	New value for the bands

Value

A vector with the names of the bands.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
if (sits_run_examples()) {
    # Create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # Get the bands from a daya cube
    bands <- sits_bands(cube)
    # Get the bands from a sits tibble
    bands <- sits_bands(samples_modis_ndvi)
    # Get the bands from patterns
    bands <- sits_bands(sits_patterns(samples_modis_ndvi))
    # Get the bands from ML model
    rf_model <- sits_train(samples_modis_ndvi, sits_rfor())
    bands <- sits_bands(rf_model)
```

```
    # Set the bands for a SITS time series
    sits_bands(samples_modis_ndvi) <- "NDVI2"
    # Set the bands for a SITS cube
    sits_bands(cube) <- "NDVI2"
}
```

`sits_bbox` *Get the bounding box of the data*

Description

Obtain a vector of limits (either on lat/long for time series or in projection coordinates in the case of cubes)

Usage

```
sits_bbox(data, crs = "EPSG:4326", as_crs = NULL)

## S3 method for class 'sits'
sits_bbox(data, crs = "EPSG:4326", as_crs = NULL)

## S3 method for class 'raster_cube'
sits_bbox(data, crs = "EPSG:4326", as_crs = NULL)

## S3 method for class 'tbl_df'
sits_bbox(data, crs = "EPSG:4326", as_crs = NULL)

## Default S3 method:
sits_bbox(data, crs = "EPSG:4326", as_crs = NULL)
```

Arguments

`data`	samples (class "sits") or cube.
`crs`	CRS of the samples points (single char)
`as_crs`	CRS to project the resulting bbox.

Value

A bbox.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
if (sits_run_examples()) {
    # get the bbox of a set of samples
    sits_bbox(samples_modis_ndvi)
    # get the bbox of a cube in WGS84
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    sits_bbox(cube, as_crs = "EPSG:4326")
}
```

`sits_classify` *Classify time series or data cubes*

Description

This function classifies a set of time series or data cube given a trained model prediction model created by `sits_train`.

SITS supports the following models: (a) support vector machines: `sits_svm`; (b) random forests: `sits_rfor`; (c) extreme gradient boosting: `sits_xgboost`; (d) multi-layer perceptrons: `sits_mlp`; (e) 1D CNN: `sits_tempcnn`; (f) self-attention encoders: `sits_lighttae` and `sits_tae`

Usage

```
sits_classify(data, ml_model, ...)

## S3 method for class 'sits'
sits_classify(
  data,
  ml_model,
  ...,
  filter_fn = NULL,
  impute_fn = impute_linear(),
  multicores = 2L,
  gpu_memory = 4,
  batch_size = 2^gpu_memory,
  progress = TRUE
)

## S3 method for class 'raster_cube'
sits_classify(
  data,
  ml_model,
  ...,
```

```
  roi = NULL,
  exclusion_mask = NULL,
  filter_fn = NULL,
  impute_fn = impute_linear(),
  start_date = NULL,
  end_date = NULL,
  memsize = 8L,
  multicores = 2L,
  gpu_memory = 4,
  batch_size = 2^gpu_memory,
  output_dir,
  version = "v1",
  verbose = FALSE,
  progress = TRUE
)

## S3 method for class 'segs_cube'
sits_classify(
  data,
  ml_model,
  ...,
  roi = NULL,
  filter_fn = NULL,
  impute_fn = impute_linear(),
  start_date = NULL,
  end_date = NULL,
  memsize = 8L,
  multicores = 2L,
  gpu_memory = 4,
  batch_size = 2^gpu_memory,
  output_dir,
  version = "v1",
  n_sam_pol = NULL,
  verbose = FALSE,
  progress = TRUE
)

## S3 method for class 'tbl_df'
sits_classify(data, ml_model, ...)

## S3 method for class 'derived_cube'
sits_classify(data, ml_model, ...)

## Default S3 method:
sits_classify(data, ml_model, ...)
```

Arguments

data	Data cube (tibble of class "raster_cube")

ml_model	R model trained by sits_train (closure of class "sits_model")
...	Other parameters for specific functions.
filter_fn	Smoothing filter to be applied - optional (closure containing object of class "function").
impute_fn	Imputation function to remove NA.
multicores	Number of cores to be used for classification (integer, min = 1, max = 2048).
gpu_memory	Memory available in GPU in GB (default = 4)
batch_size	Batch size for GPU classification.
progress	Logical: Show progress bar?
roi	Region of interest (either an sf object, shapefile, or a numeric vector with named XY values ("xmin", "xmax", "ymin", "ymax") or named lat/long values ("lon_min", "lat_min", "lon_max", "lat_max").
exclusion_mask	Areas to be excluded from the classification process. It can be defined as a sf object or a shapefile.
start_date	Start date for the classification (Date in YYYY-MM-DD format).
end_date	End date for the classification (Date in YYYY-MM-DD format).
memsize	Memory available for classification in GB (integer, min = 1, max = 16384).
output_dir	Valid directory for output file. (character vector of length 1).
version	Version of the output (character vector of length 1).
verbose	Logical: print information about processing time?
n_sam_pol	Number of time series per segment to be classified (integer, min = 10, max = 50).

Value

Time series with predicted labels for each point (tibble of class "sits") or a data cube with probabilities for each class (tibble of class "probs_cube").

Note

The roi parameter defines a region of interest. It can be an sf_object, a shapefile, or a bounding box vector with named XY values (xmin, xmax, ymin, ymax) or named lat/long values (lon_min, lon_max, lat_min, lat_max)

Parameter filter_fn parameter specifies a smoothing filter to be applied to each time series for reducing noise. Currently, options are Savitzky-Golay (see sits_sgolay) and Whittaker (see sits_whittaker) filters.

Parameter impute_fn defines a 1D function that will be used to interpolate NA values in each time series. Currently sits supports the impute_linear function, but users can define imputation functions which are defined externally.

Parameter memsize controls the amount of memory available for classification, while multicores defines the number of cores used for processing. We recommend using as much memory as possible.

Parameter exclusion_mask defines a region that will not be classify. The region can be defined by multiple polygons. Use an sf object or a shapefile to define it.

When using a GPU for deep learning, gpu_memory indicates the memory of the graphics card which is available for processing. The parameter batch_size defines the size of the matrix (measured in number of rows) which is sent to the GPU for classification. Users can test different values of batch_size to find out which one best fits their GPU architecture.

It is not possible to have an exact idea of the size of Deep Learning models in GPU memory, as the complexity of the model and factors such as CUDA Context increase the size of the model in memory. Therefore, we recommend that you leave at least 1GB free on the video card to store the Deep Learning model that will be used.

For users of Apple M3 chips or similar with a Neural Engine, be aware that these chips share memory between the GPU and the CPU. Tests indicate that the memsize should be set to half to the total memory and the batch_size parameter should be a small number (we suggest the value of 64). Be aware that increasing these parameters may lead to memory conflicts.

For classifying vector data cubes created by sits_segment, n_sam_pol controls is the number of time series to be classified per segment.

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

sits_clean *Cleans a classified map using a local window*

Description

Applies a modal function to clean up possible noisy pixels keeping the most frequently values within the neighborhood. In a tie, the first value of the vector is considered.

Usage

```
sits_clean(
  cube,
  window_size = 5L,
  memsize = 4L,
  multicores = 2L,
  output_dir,
  version = "v1-clean",
  progress = TRUE
)

## S3 method for class 'class_cube'
sits_clean(
  cube,
  window_size = 5L,
  memsize = 4L,
  multicores = 2L,
  output_dir,
  version = "v1-clean",
  progress = TRUE
)

## S3 method for class 'raster_cube'
sits_clean(
  cube,
  window_size = 5L,
  memsize = 4L,
  multicores = 2L,
  output_dir,
  version = "v1-clean",
  progress = TRUE
)

## S3 method for class 'derived_cube'
sits_clean(
  cube,
  window_size = 5L,
  memsize = 4L,
  multicores = 2L,
  output_dir,
  version = "v1-clean",
  progress = TRUE
)
```

```
## Default S3 method:
sits_clean(
  cube,
  window_size = 5L,
  memsize = 4L,
  multicores = 2L,
  output_dir,
  version = "v1-clean",
  progress = TRUE
)
```

Arguments

cube	Classified data cube (tibble of class "class_cube").
window_size	An odd integer representing the size of the sliding window of the modal function (min = 1, max = 15).
memsize	Memory available for classification in GB (integer, min = 1, max = 16384).
multicores	Number of cores to be used for classification (integer, min = 1, max = 2048).
output_dir	Valid directory for output file. (character vector of length 1).
version	Version of the output file (character vector of length 1)
progress	Logical: Show progress bar?

Value

A tibble with an classified map (class = "class_cube").

)
}
```

`sits_cluster_clean` *Removes labels that are minority in each cluster.*

Description

Takes a tibble with time series that has an additional 'cluster' produced by `link[sits]{sits_cluster_dendro()}` and removes labels that are minority in each cluster.

Usage

```
sits_cluster_clean(samples)
```

Arguments

`samples`	Tibble with set of time series with additional cluster information produced by `link[sits]{sits_cluster_dendro()}`

Value

Tibble with time series (class "sits")

Author(s)

Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
if (sits_run_examples()) {
    clusters <- sits_cluster_dendro(cerrado_2classes)
    freq1 <- sits_cluster_frequency(clusters)
    freq1
    clean_clusters <- sits_cluster_clean(clusters)
    freq2 <- sits_cluster_frequency(clean_clusters)
    freq2
}
```

`sits_cluster_dendro` *Find clusters in time series samples*

Description

These functions support hierarchical agglomerative clustering in sits. They provide support from creating a dendrogram and using it for cleaning samples.

`link[sits]{sits_cluster_dendro()}` takes a tibble with time series and produces a sits tibble with an added "cluster" column. The function first calculates a dendrogram and obtains a validity index for best clustering using the adjusted Rand Index. After cutting the dendrogram using the chosen validity index, it assigns a cluster to each sample.

`link[sits]{sits_cluster_frequency()}` computes the contingency table between labels and clusters and produces a matrix. Its input is a tibble produced by `link[sits]{sits_cluster_dendro()}`.

`link[sits]{sits_cluster_clean()}` takes a tibble with time series that has an additional 'cluster' produced by `link[sits]{sits_cluster_dendro()}` and removes labels that are minority in each cluster.

Usage

```
sits_cluster_dendro(
  samples,
  bands = NULL,
  dist_method = "dtw_basic",
  linkage = "ward.D2",
  k = NULL,
  palette = "RdYlGn",
  ...
)
```

Arguments

`samples`	Tibble with input set of time series (class "sits").
`bands`	Bands to be used in the clustering (character vector)
`dist_method`	One of the supported distances (single char vector) "dtw": DTW with a Sakoe-Chiba constraint. "dtw2": DTW with L2 norm and Sakoe-Chiba constraint. "dtw_basic": A faster DTW with less functionality. "lbk": Keogh's lower bound for DTW. "lbi": Lemire's lower bound for DTW.
`linkage`	Agglomeration method to be used (single char vector) One of "ward.D", "ward.D2", "single", "complete", "average", "mcquitty", "median" or "centroid".
`k`	Desired number of clusters (overrides default value)
`palette`	Color palette as per 'grDevices::hcl.pals()' function.
`...`	Additional parameters to be passed to dtwclust::tsclust() function.

Value

Tibble with "cluster" column (class "sits_cluster").

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

    clusters <- sits_cluster_dendro(cerrado_2classes,
                bands = "NDVI", k = 5)
}
```

---

sits_cluster_frequency

Show label frequency in each cluster produced by dendrogram analysis

---

Description

Show label frequency in each cluster produced by dendrogram analysis

Usage

```
sits_cluster_frequency(samples)
```

Arguments

samples	Tibble with input set of time series with additional cluster information produced by link[sits]{sits_cluster_dendro}.

Value

A matrix containing frequencies of labels in clusters.

Author(s)

Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
if (sits_run_examples()) {
    clusters <- sits_cluster_dendro(cerrado_2classes)
    freq <- sits_cluster_frequency(clusters)
    freq
}
```

---

sits_colors *Function to retrieve sits color table*

Description

Returns a color table

Usage

```
sits_colors(legend = NULL)
```

Arguments

legend	One of the accepted legends in sits

Value

A tibble with color names and values

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # return the names of all colors supported by SITS
    sits_colors()
}
```

`sits_colors_qgis` *Function to save color table as QML style for data cube*

Description

Saves a color table associated to a classified data cube as a QGIS style file

Usage

```
sits_colors_qgis(cube, file)
```

Arguments

`cube`	a classified data cube
`file`	a QGIS style file to be written to

Value

No return, called for side effects

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
   data_dir <- system.file("extdata/raster/classif", package = "sits")
   ro_class <- sits_cube(
      source = "MPC",
      collection = "SENTINEL-2-L2A",
      data_dir = data_dir,
      parse_info = c( "X1", "X2", "tile", "start_date", "end_date",
                      "band", "version"),
      bands = "class",
      labels = c(
           "1" = "Clear_Cut_Burned_Area",
           "2" = "Clear_Cut_Bare_Soil",
           "3" = "Clear_Cut_Vegetation",
           "4" = "Forest")
  )
  qml_file <- paste0(tempdir(), "/qgis.qml")
  sits_colors_qgis(ro_class, qml_file)
}
```

sits_colors_reset *Function to reset sits color table*

Description

Resets the color table

Usage

```
sits_colors_reset()
```

Value

No return, called for side effects

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # reset the default colors supported by SITS
    sits_colors_reset()
}
```

sits_colors_set *Function to set sits color table*

Description

Includes new colors in the SITS color sets. If the colors exist, replace them with the new HEX value. Optionally, the new colors can be associated to a legend. In this case, the new legend name should be informed. The colors parameter should be a data.frame or a tibble with name and HEX code. Colour names should be one character string only. Composite names need to be combined with underscores (e.g., use "Snow_and_Ice" and not "Snow and Ice").

This function changes the global sits color table and the global set of sits color legends. To undo these effects, please use "sits_colors_reset()".

Usage

```
sits_colors_set(colors, legend = NULL)
```

Arguments

colors	New color table (a tibble or data.frame with name and HEX code)
legend	Legend associated to the color table (optional)

Value

A modified sits color table (invisible)

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # Define a color table based on the Anderson Land Classification System
    us_nlcd <- tibble::tibble(name = character(), color = character())
    us_nlcd <- us_nlcd |>
        tibble::add_row(name = "Urban_Built_Up", color = "#85929E") |>
        tibble::add_row(name = "Agricultural_Land", color = "#F0B27A") |>
        tibble::add_row(name = "Rangeland", color = "#F1C40F") |>
        tibble::add_row(name = "Forest_Land", color = "#27AE60") |>
        tibble::add_row(name = "Water", color = "#2980B9") |>
        tibble::add_row(name = "Wetland", color = "#D4E6F1") |>
        tibble::add_row(name = "Barren_Land", color = "#FDEBD0") |>
        tibble::add_row(name = "Tundra", color = "#EBDEF0") |>
        tibble::add_row(name = "Snow_and_Ice", color = "#F7F9F9")

    # Load the color table into `sits`
    sits_colors_set(colors = us_nlcd, legend = "US_NLCD")

    # Show the new color table used by sits
    sits_colors_show("US_NLCD")

    # Change colors in the sits global color table
    # First show the default colors for the UMD legend
    sits_colors_show("UMD")
    # Then change some colors associated to the UMD legend
    mycolors <- tibble::tibble(name = character(), color = character())
    mycolors <- mycolors |>
        tibble::add_row(name = "Savannas", color = "#F8C471") |>
        tibble::add_row(name = "Grasslands", color = "#ABEBC6")
    sits_colors_set(colors = mycolors)
    # Notice that the UMD colors change
    sits_colors_show("UMD")
    # Reset the color table
    sits_colors_reset()
    # Show the default colors for the UMD legend
    sits_colors_show("UMD")
}
```

---

sits_colors_show *Function to show colors in SITS*

Description

Shows the default SITS colors

Usage

```
sits_colors_show(legend = NULL, font_family = "sans")
```

Arguments

legend	One of the accepted legends in sits
font_family	A font family loaded in SITS

Value

no return, called for side effects

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # show the colors supported by SITS
    sits_colors_show()
}
```

---

sits_combine_predictions

Estimate ensemble prediction based on list of probs cubes

Description

Calculate an ensemble predictor based a list of probability cubes. The function combines the output of two or more classifier to derive a value which is based on weights assigned to each model. The supported types of ensemble predictors are 'average' and 'uncertainty'.

Usage

```
sits_combine_predictions(cubes, type = "average", ...)

## S3 method for class 'average'
sits_combine_predictions(
  cubes,
  type = "average",
  ...,
  weights = NULL,
```

```
  memsize = 8L,
  multicores = 2L,
  output_dir,
  version = "v1"
)

## S3 method for class 'uncertainty'
sits_combine_predictions(
  cubes,
  type = "uncertainty",
  ...,
  uncert_cubes,
  memsize = 8L,
  multicores = 2L,
  output_dir,
  version = "v1"
)

## Default S3 method:
sits_combine_predictions(cubes, type, ...)
```

Arguments

cubes	List of probability data cubes (class "probs_cube")
type	Method to measure uncertainty. One of "average" or "uncertainty"
...	Parameters for specific functions.
weights	Weights for averaging (numeric vector).
memsize	Memory available for classification in GB (integer, min = 1, max = 16384).
multicores	Number of cores to be used for classification (integer, min = 1, max = 2048).
output_dir	Valid directory for output file. (character vector of length 1).
version	Version of the output (character vector of length 1).
uncert_cubes	Uncertainty cubes to be used as local weights when type = "uncertainty" is selected (list of tibbles with class "uncertainty_cube")

Value

A combined probability cube (tibble of class "probs_cube").

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
if (sits_run_examples()) {
    # create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # create a random forest model
    rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
    # classify a data cube using rfor model
    probs_rfor_cube <- sits_classify(
        data = cube, ml_model = rfor_model, output_dir = tempdir(),
        version = "rfor"
    )
    # create an SVM model
    svm_model <- sits_train(samples_modis_ndvi, sits_svm())
    # classify a data cube using SVM model
    probs_svm_cube <- sits_classify(
        data = cube, ml_model = svm_model, output_dir = tempdir(),
        version = "svm"
    )
    # create a list of predictions to be combined
    pred_cubes <- list(probs_rfor_cube, probs_svm_cube)
    # combine predictions
    comb_probs_cube <- sits_combine_predictions(
        pred_cubes,
        output_dir = tempdir()
    )
    # plot the resulting combined prediction cube
    plot(comb_probs_cube)
}
```

---

sits_confidence_sampling

Suggest high confidence samples to increase the training set.

Description

Suggest points for increasing the training set. These points are labelled with high confidence so they can be added to the training set. They need to have a satisfactory margin of confidence to be selected. The input is a probability cube. For each label, the algorithm finds out location where the machine learning model has high confidence in choosing this label compared to all others. The algorithm also considers a minimum distance between new labels, to minimize spatial autocorrelation effects. This function is best used in the following context: 1. Select an initial set of samples. 2. Train a machine learning model. 3. Build a data cube and classify it using the model. 4. Run a Bayesian smoothing in the resulting probability cube. 5. Perform confidence sampling.

The Bayesian smoothing procedure will reduce the classification outliers and thus increase the likelihood that the resulting pixels with provide good quality samples for each class.

Usage

```
sits_confidence_sampling(
  probs_cube,
  n = 20L,
  min_margin = 0.9,
  sampling_window = 10L,
  multicores = 1L,
  memsize = 1L
)
```

Arguments

probs_cube	A smoothed probability cube. See sits_classify and sits_smooth.
n	Number of suggested points per class.
min_margin	Minimum margin of confidence to select a sample
sampling_window	Window size for collecting points (in pixels). The minimum window size is 10.
multicores	Number of workers for parallel processing (integer, min = 1, max = 2048).
memsize	Maximum overall memory (in GB) to run the function.

Value

A tibble with longitude and latitude in WGS84 with locations which have high uncertainty and meet the minimum distance criteria.

Rolf Simoes, <rolf.simoes@inpe.br>

Felipe Carvalho, <felipe.carvalho@inpe.br>

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # create a data cube
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # build a random forest model
    rfor_model <- sits_train(samples_modis_ndvi, ml_method = sits_rfor())
    # classify the cube
    probs_cube <- sits_classify(
        data = cube, ml_model = rfor_model, output_dir = tempdir()
```

```
    )
    # obtain a new set of samples for active learning
    # the samples are located in uncertain places
    new_samples <- sits_confidence_sampling(probs_cube)
}
```

`sits_config` *Configure parameters for sits package*

Description

These functions load and show sits configurations.

The 'sits' package uses a configuration file that contains information on parameters required by different functions. This includes information about the image collections handled by 'sits'.

`sits_config()` loads the default configuration file and the user provided configuration file. The final configuration is obtained by overriding the options by the values provided by the user.

Usage

```
sits_config(config_user_file = NULL)
```

Arguments

`config_user_file`
: YAML user configuration file (character vector of a file with "yml" extension)

Details

Users can provide additional configuration files, by specifying the location of their file in the environmental variable `SITS_CONFIG_USER_FILE` or as parameter to this function.

To see the key entries and contents of the current configuration values, use `link[sits]{sits_config_show()}`.

Value

Called for side effects

Author(s)

Rolf Simoes, `<rolf.simoes@inpe.br>`

Examples

```
yaml_user_file <- system.file("extdata/config_user_example.yml",
                  package = "sits")
sits_config(config_user_file = yaml_user_file)
```

sits_config_show *Show current sits configuration*

Description

Prints the current sits configuration options. To show specific configuration options for a source, a collection, or a palette, users can inform the corresponding keys to `source` and `collection`.

Usage

```
sits_config_show()
```

Value

No return value, called for side effects.

Examples

```
sits_config_show()
```

sits_config_user_file *List the cloud collections supported by sits*

Description

Creates a user configuration file.

Usage

```
sits_config_user_file(file_path, overwrite = FALSE)
```

Arguments

`file_path`	file to store the user configuration file
`overwrite`	replace current configuration file?

Value

Called for side effects

Examples

```
user_file <- paste0(tempdir(), "/my_config_file.yml")
sits_config_user_file(user_file)
```

sits_cube *Create data cubes from image collections*

Description

Creates a data cube based on spatial and temporal restrictions in collections available in cloud services or local repositories. The following cloud providers are supported, based on the STAC protocol: Amazon Web Services (AWS), Brazil Data Cube (BDC), Copernicus Data Space Ecosystem (CDSE), Digital Earth Africa (DEAFRICA), Digital Earth Australia (DEAUSTRALIA), Microsoft Planetary Computer (MPC), Nasa Harmonized Landsat/Sentinel (HLS), Swiss Data Cube (SDC), TERRASCOPE or USGS Landsat (USGS). Data cubes can also be created using local files.

Usage

```
sits_cube(source, collection, ...)

## S3 method for class 'sar_cube'
sits_cube(
  source,
  collection,
  ...,
  orbit = "ascending",
  bands = NULL,
  tiles = NULL,
  roi = NULL,
  crs = NULL,
  start_date = NULL,
  end_date = NULL,
  platform = NULL,
  multicores = 2,
  progress = TRUE
)

## S3 method for class 'stac_cube'
sits_cube(
  source,
  collection,
  ...,
  bands = NULL,
  tiles = NULL,
  roi = NULL,
  crs = NULL,
  start_date = NULL,
  end_date = NULL,
  platform = NULL,
  multicores = 2,
  progress = TRUE
```

```
)

## S3 method for class 'local_cube'
sits_cube(
  source,
  collection,
  ...,
  data_dir,
  vector_dir = NULL,
  tiles = NULL,
  bands = NULL,
  vector_band = NULL,
  start_date = NULL,
  end_date = NULL,
  labels = NULL,
  parse_info = NULL,
  version = "v1",
  delim = "_",
  multicores = 2L,
  progress = TRUE
)
```

Arguments

source	Data source (one of "AWS", "BDC", "DEAFRICA", "MPC", "SDC", "USGS" - character vector of length 1).
collection	Image collection in data source (character vector of length 1). To find out the supported collections, use sits_list_collections()).
...	Other parameters to be passed for specific types.
orbit	Orbit name ("ascending", "descending") for SAR cubes.
bands	Spectral bands and indices to be included in the cube (optional - character vector). Use sits_list_collections() to find out the bands available for each collection.
tiles	Tiles from the collection to be included in the cube (see details below) (character vector of length 1).
roi	Region of interest (either an sf object, shapefile, SpatExtent, or a numeric vector with named XY values ("xmin", "xmax", "ymin", "ymax") or named lat/long values ("lon_min", "lat_min", "lon_max", "lat_max").
crs	The Coordinate Reference System (CRS) of the roi. It must be specified when roi is named XY values ("xmin", "xmax", "ymin", "ymax") or SpatExtent
start_date, end_date	Initial and final dates to include images from the collection in the cube (optional). (Date in YYYY-MM-DD format).
platform	Optional parameter specifying the platform in case of collections that include more than one satellite (character vector of length 1).
multicores	Number of workers for parallel processing (integer, min = 1, max = 2048).

progress	Logical: show a progress bar?
data_dir	Local directory where images are stored (for local cubes - character vector of length 1).
vector_dir	Local director where vector files are stored (for local vector cubes - character vector of length 1).
vector_band	Band for vector cube ("segments", "probs", "class")
labels	Labels associated to the classes (Named character vector for cubes of classes "probs_cube" or "class_cube").
parse_info	Parsing information for local files (for local cubes - character vector).
version	Version of the classified and/or labelled files. (for local cubes - character vector of length 1).
delim	Delimiter for parsing local files (single character)

Value

A tibble describing the contents of a data cube.

Note

To create cubes from cloud providers, users need to inform:

1. source: One of "AWS", "BDC", "CDSE", "DEAFRICA", "DEAUSTRALIA", "HLS", "MPC", "SDC", "TERRASCOPE", or "USGS";
2. collection: Collection available in the cloud provider. Use sits_list_collections() to see which collections are supported;
3. tiles: A set of tiles defined according to the collection tiling grid;
4. roi: Region of interest. Either a shapefile, a named vector ("lon_min", "lat_min", "lon_max", "lat_max") in WGS84, a sfc or sf object from sf package in WGS84 projection. A named vector ("xmin", "xmax", "ymin", "ymax") or a SpatExtent can also be used, requiring only the specification of the crs parameter.

The parameter bands, start_date, and end_date are optional for cubes created from cloud providers.

Either tiles or roi must be informed. The roi parameter is used to select images. This parameter does not crop a region; it only selects images that intersect it.

If you want to use GeoJSON geometries (RFC 7946) as value roi, you can convert it to sf object and then use it.

sits can access data from multiple providers, including Amazon Web Services (AWS), Microsoft Planetary Computer (MPC), Brazil Data Cube (BDC), Copernicus Data Space Ecosystem (CDSE), Digital Earth Africa, Digital Earth Australia, NASA EarthData, Terrascope and more.

In each provider, sits can access multiple collections. For example, in MPC sits can access multiple open data collections, including "SENTINEL-2-L2A" for Sentinel-2/2A images, and "LANDSAT-C2-L2" for the Landsat-4/5/7/8/9 collection.

In AWS, there are two types of collections: open data and requester-pays. Currently, sits supports collections "SENTINEL-2-L2A", "SENTINEL-S2-L2A-COGS" (open data) and "LANDSAT-C2-L2" (requester-pays). There is no need to provide AWS credentials to access open data collections. For requester-pays data, you need to provide your AWS access codes as environment variables, as follows:

```
Sys.setenv( AWS_ACCESS_KEY_ID = <your_access_key>, AWS_SECRET_ACCESS_KEY = <your_secret_access_key>
)
```

In BDC, there are many collections, including "LANDSAT-OLI-16D" (Landsat-8 OLI, 30 m resolution, 16-day intervals), "SENTINEL-2-16D" (Sentinel-2A and 2B MSI images at 10 m resolution, 16-day intervals), "CBERS-WFI-16D" (CBERS 4 WFI, 64 m resolution, 16-day intervals), and others. All BDC collections are regularized.

To explore providers and collections sits supports, use the sits_list_collections() function.

If you want to learn more details about each provider and collection available in sits, please read the online sits book (e-sensing.github.io/sitsbook). The chapter Earth Observation data cubes provides a detailed description of all collections you can use with sits (e-sensing.github.io/sitsbook/earth-observation-data-cubes.html).

To create a cube from local files, you need to inform:

1. source: The data provider from which the data was downloaded (e.g, "BDC", "MPC");
2. collection: The collection from which the data comes from. (e.g., "SENTINEL-2-L2A" for the Sentinel-2 MPC collection level 2A);
3. data_dir: The local directory where the image files are stored.
4. parse_info: Defines how to extract metadata from file names by specifying the order and meaning of each part, separated by the "delim" character. Default value is c("X1", "X2", "tile", "band", "date").
5. delim: The delimiter character used to separate components in the file names. Default is "_".

Note that if you are working with local data cubes created by sits, you do not need to specify parse_info and delim. These elements are automatically identified. This is particularly useful when you have downloaded or created data cubes using sits.

For example, if you downloaded a data cube from the Microsoft Planetary Computer (MPC) using the function sits_cube_copy(), you do not need to provide parse_info and delim.

If you are using a data cube from a source supported by sits (e.g., AWS, MPC) but downloaded / managed with an external tool, you will need to specify the parse_info and delim parameters manually. For this case, you first need to ensure that the local files meet some critical requirements:

- All image files must have the same spatial resolution and projection;
- Each file should represent a single image band for a single date;
- File names must include information about the "tile", "date", and "band" in the file.

For example, if you are creating a Sentinel-2 data cube on your local machine, and the files have the same spatial resolution and projection, with each file containing a single band and date, an acceptable file name could be:

- "SENTINEL-2_MSI_20LKP_B02_2018-07-18.jp2"

This file name works because it encodes the three key pieces of information used by sits:

- Tile: "20LKP";
- Band: "B02";
- Date: "2018-07-18"

Other example of supported file names are:

- "CBERS-4_WFI_022024_B13_2021-05-15.tif";
- "SENTINEL-1_GRD_30TXL_VV_2023-03-10.tif";
- "LANDSAT-8_OLI_198030_B04_2020-09-12.tif".

The parse_info parameter tells sits how to extract essential metadata from file names. It defines the sequence of components in the file name, assigning each part a label such as "tile", "band", and "date". For parts of the file name that are irrelevant to sits, you can use dummy labels like "X1", "X2", and so on.

For example, consider the file name:

- "SENTINEL-2_MSI_20LKP_B02_2018-07-18.jp2"

With parse_info = c("X1", "X2", "tile", "band", "date") and delim = "_", the extracted metadata would be:

- X1: "SENTINEL-2" (ignored)
- X2: "MSI" (ignored)
- tile: "20LKP" (used)
- band: "B02" (used)
- date: "2018-07-18" (used)

The delim parameter specifies the character that separates components in the file name. The default delimiter is "_".

Note that when you load a local data cube specifying the source (e.g., AWS, MPC) and collection, sits assumes that the data properties (e.g., scale factor, minimum, and maximum values) match those defined for the selected provider. However, if you are working with custom data from an unsupported source or data that does not follow the standard definitions of providers in sits, refer to the Technical Annex of the sits online book for guidance on handling such cases (e-sensing.github.io/sitsbook/technical-annex.html).

It is also possible to create result cubes from local files produced by classification or post-classification algorithms. In this case, the parse_info is specified differently, and other additional parameters are required:

- band: Band name associated to the type of result. Use "probs", for probability cubes produced by sits_classify(); "bayes", for smoothed cubes produced by sits_smooth(); "segments", for vector cubes produced by sits_segment(); "entropy" when using sits_uncertainty(), and "class" for cubes produced by sits_label_classification();
- labels: Labels associated to the classification results;
- parse_info: File name parsing information to deduce the values of "tile", "start_date", "end_date" from the file name. Unlike non-classified image files, cubes with results have both "start_date" and "end_date". Default is c("X1", "X2", "tile", "start_date", "end_date", "band").

Examples

```
if (sits_run_examples()) {
    # --- Access to the Brazil Data Cube
    # create a raster cube file based on the information in the BDC
    cbers_tile <- sits_cube(
        source = "BDC",
        collection = "CBERS-WFI-16D",
        bands = c("NDVI", "EVI"),
        tiles = "007004",
        start_date = "2018-09-01",
        end_date = "2019-08-28"
    )
    # --- Access to Digital Earth Africa
    # create a raster cube file based on the information about the files
    # DEAFRICA does not support definition of tiles
    cube_deafrica <- sits_cube(
        source = "DEAFRICA",
        collection = "SENTINEL-2-L2A",
        bands = c("B04", "B08"),
        roi = c(
            "lat_min" = 17.379,
            "lon_min" = 1.1573,
            "lat_max" = 17.410,
            "lon_max" = 1.1910
        ),
        start_date = "2019-01-01",
        end_date = "2019-10-28"
    )
    # --- Access to Digital Earth Australia
    cube_deaustralia <- sits_cube(
        source = "DEAUSTRALIA",
        collection = "GA_LS8CLS9C_GM_CYEAR_3",
        bands = c("RED", "GREEN", "BLUE"),
        roi = c(
            lon_min = 137.15991,
            lon_max = 138.18467,
            lat_min = -33.85777,
            lat_max = -32.56690
        ),
        start_date = "2018-01-01",
        end_date = "2018-12-31"
    )
    # --- Access to CDSE open data Sentinel 2/2A level 2 collection
    # --- remember to set the appropriate environmental variables
    # It is recommended that `multicores` be used to accelerate the process.
    s2_cube <- sits_cube(
        source = "CDSE",
        collection = "SENTINEL-2-L2A",

# --- Create a cube based on a local MODIS data
# MODIS local files have names such as
# "TERRA_MODIS_012010_NDVI_2013-09-14.jp2"
# see the parse info parameter as an example on how to
# decode local files
data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
modis_cube <- sits_cube(
    source = "BDC",
    collection = "MOD13Q1-6.1",
    data_dir = data_dir,
    parse_info = c("satellite", "sensor", "tile", "band", "date")
)

}
```

`sits_cube_copy` *Copy the images of a cube to a local directory*

Description

This function downloads the images of a cube in parallel. A region of interest (`roi`) can be provided to crop the images and a resolution (`res`) to resample the bands.

Usage

```
sits_cube_copy(
  cube,
  roi = NULL,
  res = NULL,
  crs = NULL,
  n_tries = 3,
```

```
  multicores = 2L,
  output_dir,
  progress = TRUE
)
```

Arguments

cube	A data cube (class "raster_cube")
roi	Region of interest. Either an sf_object, a shapefile, or a bounding box vector with named XY values ("xmin", "xmax", "ymin", "ymax") or named lat/long values ("lon_min", "lat_min", "lon_max", "lat_max").
res	An integer value corresponds to the output spatial resolution of the images. Default is NULL.
crs	Reference system for output cube (by default, the same CRS from the input cube is assumed)
n_tries	Number of attempts to download the same image. Default is 3.
multicores	Number of cores for parallel downloading (integer, min = 1, max = 2048).
output_dir	Output directory where images will be saved. (character vector of length 1).
progress	Logical: show progress bar?

Value

Copy of input data cube (class "raster cube").

Examples

```
if (sits_run_examples()) {
    # Creating a sits cube from BDC
    bdc_cube <- sits_cube(
        source = "BDC",
        collection = "CBERS-WFI-16D",
        tiles = c("007004", "007005"),
        bands = c("B15", "CLOUD"),
        start_date = "2018-01-01",
        end_date = "2018-01-12"
    )
    # Downloading images to a temporary directory
    cube_local <- sits_cube_copy(
        cube = bdc_cube,
        output_dir = tempdir(),
        roi = c(
            lon_min = -46.5,
            lat_min = -45.5,
            lon_max = -15.5,
            lat_max = -14.6
        ),
        multicores = 2L,
        res = 250,
    )
```

```
}
```

`sits_factory_function` *Create a closure for calling functions with and without data*

Description

This function implements the factory method pattern. Its creates a generic interface to closures in R so that the functions in the sits package can be called in two different ways: 1. Called directly, passing input data and parameters. 2. Called as second-order values (parameters of another function). In the second case, the call will pass no data values and only pass the parameters for execution

The factory pattern is used in many situations in the sits package, to allow different alternatives for filtering, pattern creation, training, and cross-validation

Please see the chapter "Technical Annex" in the sits book for details.

Usage

```
sits_factory_function(data, fun)
```

Arguments

`data`	Input data.
`fun`	Function that performs calculation on the input data.

Value

A closure that encapsulates the function applied to data.

Author(s)

Rolf Simoes, <rolf.simoes@inpe.br>

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
# example code
if (sits_run_examples()) {
    # Include a new machine learning function (multiple linear regression)
    # function that returns mlr model based on a sits sample tibble

    sits_mlr <- function(samples = NULL, formula = sits_formula_linear(),
                         n_weights = 20000, maxit = 2000) {
        train_fun <- function(samples) {
            # Data normalization
            ml_stats <- sits_stats(samples)
            train_samples <- sits_predictors(samples)
            train_samples <- sits_pred_normalize(
```

```
                pred = train_samples,
                stats = ml_stats
            )
            formula <- formula(train_samples[, -1])
            # call method and return the trained model
            result_mlr <- nnet::multinom(
                formula = formula,
                data = train_samples,
                maxit = maxit,
                MaxNWts = n_weights,
                trace = FALSE,
                na.action = stats::na.fail
            )

            # construct model predict closure function and returns
            predict_fun <- function(values) {
                # retrieve the prediction (values and probs)
                prediction <- tibble::as_tibble(
                    stats::predict(result_mlr,
                        newdata = values,
                        type = "probs"
                    )
                )
                return(prediction)
            }
            class(predict_fun) <- c("sits_model", class(predict_fun))
            return(predict_fun)
        }
        result <- sits_factory_function(samples, train_fun)
        return(result)
    }
    # create an mlr model using a set of samples
    mlr_model <- sits_train(samples_modis_ndvi, sits_mlr)
    # classify a point
    point_ndvi <- sits_select(point_mt_6bands, bands = "NDVI")
    point_class <- sits_classify(point_ndvi, mlr_model, multicores = 1)
    plot(point_class)
}
```

`sits_filter` *Filter time series with smoothing filter*

Description

Applies a filter to all bands, using a filter function such as sits_whittaker() or sits_sgolay().

Usage

```
sits_filter(data, filter = sits_whittaker())
```

Arguments

data	Time series (tibble of class "sits") or matrix.
filter	Filter function to be applied.

Value

Filtered time series

Examples

```
if (sits_run_examples()) {
    # Retrieve a time series with values of NDVI
    point_ndvi <- sits_select(point_mt_6bands, bands = "NDVI")
    # Filter the point using the Whittaker smoother
    point_whit <- sits_filter(point_ndvi, sits_whittaker(lambda = 3.0))
    # Merge time series
    point_ndvi <- sits_merge(point_ndvi, point_whit,
                             suffix = c("", ".WHIT"))
    # Plot the two points to see the smoothing effect
    plot(point_ndvi)
}
```

---

sits_formula_linear *Define a linear formula for classification models*

Description

Provides a symbolic description of a fitting model. Tells the model to do a linear transformation of the input values. The 'predictors_index' parameter informs the positions of fields corresponding to formula independent variables. If no value is given, that all fields will be used as predictors.

Usage

```
sits_formula_linear(predictors_index = -2:0)
```

Arguments

predictors_index	Index of the valid columns whose names are used to compose formula (default: -2:0).

Value

A function that computes a valid formula using a linear function.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Alexandre Ywata de Carvalho, <alexandre.ywata@ipea.gov.br>

Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
if (sits_run_examples()) {
    # Example of training a model for time series classification
    # Retrieve the samples for Mato Grosso
    # train an SVM model
    ml_model <- sits_train(samples_modis_ndvi,
        ml_method = sits_svm(formula = sits_formula_logref())
    )
    # classify the point
    point_ndvi <- sits_select(point_mt_6bands, bands = "NDVI")
    # classify the point
    point_class <- sits_classify(
        data = point_ndvi, ml_model = ml_model
    )
    plot(point_class)
}
```

---

sits_formula_logref *Define a loglinear formula for classification models*

Description

A function to be used as a symbolic description of some fitting models such as svm and random forest. This function tells the models to do a log transformation of the inputs. The 'predictors_index' parameter informs the positions of 'tb' fields corresponding to formula independent variables. If no value is given, the default is NULL, a value indicating that all fields will be used as predictors.

Usage

```
sits_formula_logref(predictors_index = -2:0)
```

Arguments

predictors_index	Index of the valid columns to compose formula (default: -2:0).

Value

A function that computes a valid formula using a log function.

Author(s)

Alexandre Ywata de Carvalho, <alexandre.ywata@ipea.gov.br>

Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
if (sits_run_examples()) {
    # Example of training a model for time series classification
    # Retrieve the samples for Mato Grosso
    # train an SVM model
    ml_model <- sits_train(samples_modis_ndvi,
        ml_method = sits_svm(formula = sits_formula_logref())
    )
    # classify the point
    point_ndvi <- sits_select(point_mt_6bands, bands = "NDVI")
    # classify the point
    point_class <- sits_classify(
        data = point_ndvi, ml_model = ml_model
    )
    plot(point_class)
}
```

---

sits_geo_dist *Compute the minimum distances among samples and prediction points.*

Description

Compute the minimum distances among samples and samples to prediction points, following the approach proposed by Meyer and Pebesma(2022).

Usage

```
sits_geo_dist(samples, roi, n = 1000L, crs = "EPSG:4326")
```

Arguments

samples	Time series (tibble of class "sits").
roi	A region of interest (ROI), either a file containing a shapefile or an "sf" object
n	Maximum number of samples to consider (integer)
crs	CRS of the samples.

Value

A tibble with sample-to-sample and sample-to-prediction distances (object of class "distances").

Examples

```
if (sits_run_examples()) {
    # read a shapefile for the state of Mato Grosso, Brazil
    mt_shp <- system.file("extdata/shapefiles/mato_grosso/mt.shp",
        package = "sits"
    )
    # convert to an sf object
    mt_sf <- sf::read_sf(mt_shp)
    # calculate sample-to-sample and sample-to-prediction distances
    distances <- sits_geo_dist(
        samples = samples_modis_ndvi,
        roi = mt_sf
    )
    # plot sample-to-sample and sample-to-prediction distances
    plot(distances)
}
```

---

sits_get_class *Get values from classified maps*

Description

Given a set of lat/long locations and a classified cube, retrieve the class of each point.

Usage

```
sits_get_class(cube, samples)

## Default S3 method:
sits_get_class(cube, samples)

## S3 method for class 'csv'
sits_get_class(cube, samples)
```

```
## S3 method for class 'shp'
sits_get_class(cube, samples)

## S3 method for class 'sf'
sits_get_class(cube, samples)

## S3 method for class 'sits'
sits_get_class(cube, samples)

## S3 method for class 'data.frame'
sits_get_class(cube, samples)
```

Arguments

cube	Classified data cube from where data is to be retrieved. (class "class_cube").
samples	Location of the samples to be retrieved. Either a tibble of class "sits", an "sf" object, the name of a shapefile or csv file, or a data.frame with columns "longitude" and "latitude"

Value

A tibble of with columns <longitude, latitude, start_date, end_date, label>.

Note

There are four ways of specifying data to be retrieved using the `samples` parameter: (a) CSV file: a CSV file with columns `longitude`, `latitude`; (b) SHP file: a shapefile in POINT geometry; (c) sits object: A sits tibble; (d) sf object: An `link[sf]{sf}` object with POINT or geometry; (e) data.frame: A data.frame with `longitude` and `latitude`.

Author(s)

Gilberto Camara

`sits_get_data` *Get time series from data cubes and cloud services*

Description

Retrieve a set of time series from a data cube or from a time series service. Data cubes and puts it in a "sits tibble". Sits tibbles are the main structures of sits package. They contain both the satellite image time series and their metadata.

Usage

```
sits_get_data(cube, samples, ...)

## Default S3 method:
sits_get_data(cube, samples, ...)

## S3 method for class 'csv'
sits_get_data(
  cube,
  samples,
  ...,
  bands = NULL,
  crs = "EPSG:4326",
  impute_fn = impute_linear(),
  multicores = 2,
  progress = FALSE
)

## S3 method for class 'shp'
sits_get_data(
  cube,
  samples,
  ...,
  label = "NoClass",
  start_date = NULL,
  end_date = NULL,
  bands = NULL,
  impute_fn = impute_linear(),
  label_attr = NULL,
  n_sam_pol = 30,
  pol_avg = FALSE,
  pol_id = NULL,
  sampling_type = "random",
  multicores = 2,
  progress = FALSE
)

## S3 method for class 'sf'
sits_get_data(
  cube,
  samples,
  ...,
  start_date = NULL,
  end_date = NULL,
  bands = NULL,
  impute_fn = impute_linear(),
  label = "NoClass",
  label_attr = NULL,
```

```
  n_sam_pol = 30,
  pol_avg = FALSE,
  pol_id = NULL,
  sampling_type = "random",
  multicores = 2,
  progress = FALSE
)

## S3 method for class 'sits'
sits_get_data(
  cube,
  samples,
  ...,
  bands = NULL,
  crs = "EPSG:4326",
  impute_fn = impute_linear(),
  multicores = 2,
  progress = FALSE
)

## S3 method for class 'data.frame'
sits_get_data(
  cube,
  samples,
  ...,
  start_date = NULL,
  end_date = NULL,
  bands = NULL,
  label = "NoClass",
  crs = "EPSG:4326",
  impute_fn = impute_linear(),
  multicores = 2,
  progress = FALSE
)
```

Arguments

cube	Data cube from where data is to be retrieved. (tibble of class "raster_cube").
samples	Location of the samples to be retrieved. Either a tibble of class "sits", an "sf" object, the name of a shapefile or csv file, or a data.frame with columns "longitude" and "latitude".
...	Specific parameters for specific cases.
bands	Bands to be retrieved - optional (character vector).
crs	Default crs for the samples (character vector of length 1).
impute_fn	Imputation function to remove NA.
multicores	Number of threads to process the time series (integer, with min = 1 and max = 2048).

progress	Logical: show progress bar?
label	Label to be assigned to the time series (optional) (character vector of length 1).
start_date	Start of the interval for the time series - optional (Date in "YYYY-MM-DD" format).
end_date	End of the interval for the time series - optional (Date in "YYYY-MM-DD" format).
label_attr	Attribute in the shapefile or sf object to be used as a polygon label. (character vector of length 1).
n_sam_pol	Number of samples per polygon to be read for POLYGON or MULTIPOLYGON shapefiles or sf objects (single integer).
pol_avg	Logical: summarize samples for each polygon?
pol_id	ID attribute for polygons (character vector of length 1)
sampling_type	Spatial sampling type: random, hexagonal, regular, or Fibonacci.

Value

A tibble of class "sits" with set of time series <longitude, latitude, start_date, end_date, label>.

Note

There are four ways of specifying data to be retrieved using the samples parameter: (a) CSV file: a CSV file with columns longitude, latitude, start_date, end_date and label for each sample; (b) SHP file: a shapefile in POINT or POLYGON geometry containing the location of the samples and an attribute to be used as label. Also, provide start and end date for the time series; (c) sits object: A sits tibble; (d) sf object: An link[sf]{sf} object with POINT or POLYGON geometry; (e) data.frame: A data.frame with with mandatory columns longitude and latitude.

Author(s)

Gilberto Camara

Examples

```
if (sits_run_examples()) {
    # reading a lat/long from a local cube
    # create a cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    raster_cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    samples <- tibble::tibble(longitude = -55.66738, latitude = -11.76990)
    point_ndvi <- sits_get_data(raster_cube, samples)
    #
    # reading samples from a cube based on a  CSV file
    csv_file <- system.file("extdata/samples/samples_sinop_crop.csv",
        package = "sits"
```

```
    )
    points <- sits_get_data(cube = raster_cube, samples = csv_file)

    # reading a shapefile from BDC (Brazil Data Cube)
    bdc_cube <- sits_cube(
            source = "BDC",
            collection = "CBERS-WFI-16D",
            bands = c("NDVI", "EVI"),
            tiles = c("007004", "007005"),
            start_date = "2018-09-01",
            end_date = "2018-10-28"
    )
    # define a shapefile to be read from the cube
    shp_file <- system.file("extdata/shapefiles/bdc-test/samples.shp",
            package = "sits"
    )
    # get samples from the BDC based on the shapefile
    time_series_bdc <- sits_get_data(
        cube = bdc_cube,
        samples = shp_file
    )
}
```

`sits_get_probs` *Get values from probability maps*

Description

Given a set of lat/long locations and a probability cube, retrieve the prob values of each point.

Usage

```
sits_get_probs(cube, samples, window_size = NULL)

## S3 method for class 'csv'
sits_get_probs(cube, samples, window_size = NULL)

## S3 method for class 'shp'
sits_get_probs(cube, samples, window_size = NULL)

## S3 method for class 'sf'
sits_get_probs(cube, samples, window_size = NULL)

## S3 method for class 'sits'
sits_get_probs(cube, samples, window_size = NULL)

## S3 method for class 'data.frame'
sits_get_probs(cube, samples, window_size = NULL)
```

```
## Default S3 method:
sits_get_probs(cube, samples, window_size = NULL)
```

Arguments

cube	Probability data cube from where data is to be retrieved. (class "class_cube").
samples	Location of the samples to be retrieved. Either a tibble of class "sits", an "sf" object, the name of a shapefile or csv file, or a data.frame with columns "longitude" and "latitude"
window_size	Size of window around pixel (optional)

Value

A tibble of with columns <longitude, latitude, values> in case no windows are requested and <longitude, latitude, neighbors> in case windows are requested

Note

There are four ways of specifying data to be retrieved using the samples parameter: (a) CSV file: a CSV file with columns longitude, latitude; (b) SHP file: a shapefile in POINT geometry; (c) sits object: A sits tibble; (d) sf object: An link[sf]{sf} object with POINT or geometry; (e) data.frame: A data.frame with longitude and latitude.

sits_impute *Replace NA values in time series with imputation function*

Description

Remove NA

Usage

```
sits_impute(samples, impute_fn = impute_linear())
```

Arguments

samples	A time series tibble
impute_fn	Imputation function

Value

A set of filtered time series using the imputation function.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

`sits_kfold_validate` *Cross-validate time series samples*

Description

Splits the set of time series into training and validation and perform k-fold cross-validation. Cross-validation is a technique for assessing how the results of a statistical analysis will generalize to an independent data set. It is mainly used in settings where the goal is prediction, and one wants to estimate how accurately a predictive model will perform. One round of cross-validation involves partitioning a sample of data into complementary subsets, performing the analysis on one subset (called the training set), and validating the analysis on the other subset (called the validation set or testing set).

The k-fold cross validation method involves splitting the dataset into k-subsets. For each subset is held out while the model is trained on all other subsets. This process is completed until accuracy is determine for each instance in the dataset, and an overall accuracy estimate is provided.

This function returns the confusion matrix, and Kappa values.

Usage

```
sits_kfold_validate(
  samples,
  folds = 5,
  ml_method = sits_rfor(),
  filter_fn = NULL,
  impute_fn = impute_linear(),
  multicores = 2,
  gpu_memory = 4,
  batch_size = 2^gpu_memory,
  progress = TRUE
)
```

Arguments

`samples`	Time series.
`folds`	Number of partitions to create.
`ml_method`	Machine learning method.
`filter_fn`	Smoothing filter to be applied - optional (closure containing object of class "function").
`impute_fn`	Imputation function to remove NA.
`multicores`	Number of cores to process in parallel.
`gpu_memory`	Memory available in GPU in GB (default = 4)
`batch_size`	Batch size for GPU classification.
`progress`	Logical: Show progress bar?

Value

A `caret::confusionMatrix` object to be used for validation assessment.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Rolf Simoes, <rolf.simoes@inpe.br>

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # A dataset containing a tibble with time series samples
    # for the Mato Grosso state in Brasil
    # create a list to store the results
    results <- list()
    # accuracy assessment lightTAE
    acc_rfor <- sits_kfold_validate(
        samples_modis_ndvi,
        folds = 5,
        ml_method = sits_rfor()
    )
    # use a name
    acc_rfor$name <- "Rfor"
    # put the result in a list
    results[[length(results) + 1]] <- acc_rfor
    # save to xlsx file
    sits_to_xlsx(
        results,
        file = tempfile("accuracy_mato_grosso_dl_", fileext = ".xlsx")
    )
}
```

---

sits_labels *Get labels associated to a data set*

Description

Finds labels in a sits tibble or data cube

Usage

```
sits_labels(data)

## S3 method for class 'sits'
sits_labels(data)

## S3 method for class 'derived_cube'
sits_labels(data)

## S3 method for class 'derived_vector_cube'
sits_labels(data)

## S3 method for class 'raster_cube'
sits_labels(data)

## S3 method for class 'patterns'
sits_labels(data)

## S3 method for class 'sits_model'
sits_labels(data)

## Default S3 method:
sits_labels(data)
```

Arguments

data	Time series (tibble of class "sits"), patterns (tibble of class "patterns"), data cube (tibble of class "raster_cube"), or model (closure of class "sits_model").

Value

The labels of the input data (character vector).

Author(s)

Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
if (sits_run_examples()) {
    # get the labels for a time series set
    labels_ts <- sits_labels(samples_modis_ndvi)
    # get labels for a set of patterns
    labels_pat <- sits_labels(sits_patterns(samples_modis_ndvi))
    # create a random forest model
    rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
    # get lables for the model
    labels_mod <- sits_labels(rfor_model)
    # create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
```

```
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # classify a data cube
    probs_cube <- sits_classify(
        data = cube, ml_model = rfor_model, output_dir = tempdir()
    )
    # get the labels for a probs cube
    labels_probs <- sits_labels(probs_cube)
}
```

`sits_labels_summary` *Inform label distribution of a set of time series*

Description

Describes labels in a sits tibble

Usage

```
sits_labels_summary(data)

## S3 method for class 'sits'
sits_labels_summary(data)
```

Arguments

`data`	Data.frame - Valid sits tibble

Value

A tibble with the frequency of each label.

Author(s)

Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
# read a tibble with 400 samples of Cerrado and 346 samples of Pasture
data(cerrado_2classes)
# print the labels
sits_labels_summary(cerrado_2classes)
```

sits_label_classification *Build a labelled image from a probability cube*

Description

Takes a set of classified raster layers with probabilities, and label them based on the maximum probability for each pixel.

Usage

```
sits_label_classification(cube, ...)

## S3 method for class 'probs_cube'
sits_label_classification(
  cube,
  ...,
  memsize = 4L,
  multicores = 2L,
  output_dir,
  version = "v1",
  progress = TRUE
)

## S3 method for class 'probs_vector_cube'
sits_label_classification(
  cube,
  ...,
  output_dir,
  version = "v1",
  progress = TRUE
)

## S3 method for class 'raster_cube'
sits_label_classification(cube, ...)

## S3 method for class 'derived_cube'
sits_label_classification(cube, ...)

## Default S3 method:
sits_label_classification(cube, ...)
```

Arguments

cube	Classified image data cube.
...	Other parameters for specific functions.

memsize	maximum overall memory (in GB) to label the classification.
multicores	Number of workers to label the classification in parallel.
output_dir	Output directory for classified files.
version	Version of resulting image (in the case of multiple runs).
progress	Show progress bar?

Value

A data cube with an image with the classified map.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Rolf Simoes, <rolf.simoes@inpe.br>

Felipe Souza, <felipe.souza@inpe.br>

Examples

```
if (sits_run_examples()) {
    # create a random forest model
    rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
    # create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # classify a data cube
    probs_cube <- sits_classify(
        data = cube, ml_model = rfor_model, output_dir = tempdir()
    )
    # plot the probability cube
    plot(probs_cube)
    # smooth the probability cube using Bayesian statistics
    bayes_cube <- sits_smooth(probs_cube, output_dir = tempdir())
    # plot the smoothed cube
    plot(bayes_cube)
    # label the probability cube
    label_cube <- sits_label_classification(
        bayes_cube,
        output_dir = tempdir()
    )
    # plot the labelled cube
    plot(label_cube)
}
```

`sits_lighttae` *Train a model using Lightweight Temporal Self-Attention Encoder*

Description

Implementation of Light Temporal Attention Encoder (L-TAE) for satellite image time series

This function is based on the paper by Vivien Garnot referenced below and code available on github at https://github.com/VSainteuf/lightweight-temporal-attention-pytorch If you use this method, please cite the original TAE and the LTAE paper.

We also used the code made available by Maja Schneider in her work with Marco Körner referenced below and available at https://github.com/maja601/RC2020-psetae.

Usage

```
sits_lighttae(
  samples = NULL,
  samples_validation = NULL,
  epochs = 150,
  batch_size = 128,
  validation_split = 0.2,
  optimizer = torch::optim_adamw,
  opt_hparams = list(lr = 5e-04, eps = 1e-08, weight_decay = 7e-04),
  lr_decay_epochs = 50L,
  lr_decay_rate = 1,
  patience = 20L,
  min_delta = 0.01,
  verbose = FALSE
)
```

Arguments

`samples`	Time series with the training samples (tibble of class "sits").
`samples_validation`	Time series with the validation samples (tibble of class "sits"). If `samples_validation` parameter is provided, `validation_split` is ignored.
`epochs`	Number of iterations to train the model (integer, min = 1, max = 20000).
`batch_size`	Number of samples per gradient update (integer, min = 16L, max = 2048L)
`validation_split`	Fraction of training data to be used as validation data.
`optimizer`	Optimizer function to be used.
`opt_hparams`	Hyperparameters for optimizer: `lr` : Learning rate of the optimizer `eps`: Term added to the denominator to improve numerical stability. `weight_decay`: L2 regularization rate.
`lr_decay_epochs`	Number of epochs to reduce learning rate.

lr_decay_rate	Decay factor for reducing learning rate.
patience	Number of epochs without improvements until training stops.
min_delta	Minimum improvement in loss function to reset the patience counter.
verbose	Verbosity mode (TRUE/FALSE). Default is FALSE.

Value

A fitted model to be used for classification of data cubes.

    plot(bayes_cube)
```

```
    # label the probability cube
    label_cube <- sits_label_classification(
        bayes_cube,
        output_dir = tempdir()
    )
    # plot the labelled cube
    plot(label_cube)
}
```

`sits_list_collections` *List the cloud collections supported by sits*

Description

Prints the collections available in each cloud service supported by sits. Users can select to get information only for a single service by using the `source` parameter.

Usage

```
sits_list_collections(source = NULL)
```

Arguments

`source`	Data source to be shown in detail.

Value

Prints collections available in each cloud service supported by sits.

Examples

```
if (sits_run_examples()) {
    # show the names of the colors supported by SITS
    sits_list_collections()
}
```

`sits_merge` *Merge two data sets (time series or cubes)*

Description

To merge two series, we consider that they contain different attributes but refer to the same data cube and spatiotemporal location. This function is useful for merging different bands of the same location. For example, one may want to put the raw and smoothed bands for the same set of locations in the same tibble.

In the case of data cubes, the function merges the images based on the following conditions:

1. If the two cubes have different bands but compatible timelines, the bands are combined, and the timeline is adjusted to overlap. To create the overlap, we align the timelines like a "zipper": for each interval defined by a pair of consecutive dates in the first timeline, we include matching dates from the second timeline. If the second timeline has multiple dates in the same interval, only the minimum date is kept. This ensures the final timeline avoids duplicates and is consistent. This is useful when merging data from different sensors (e.g., Sentinel-1 with Sentinel-2).
2. If the bands are the same, the cube will have the combined timeline of both cubes. This is useful for merging data from the same sensors from different satellites (e.g., Sentinel-2A with Sentinel-2B).
3. otherwise, the function will produce an error.

Usage

```
sits_merge(data1, data2, ...)

## S3 method for class 'sits'
sits_merge(data1, data2, ..., suffix = c(".1", ".2"))

## S3 method for class 'raster_cube'
sits_merge(data1, data2, ...)

## Default S3 method:
sits_merge(data1, data2, ...)
```

Arguments

data1	Time series (tibble of class "sits") or data cube (tibble of class "raster_cube") .
data2	Time series (tibble of class "sits") or data cube (tibble of class "raster_cube") .
...	Additional parameters
suffix	If data1 and data2 are tibble with duplicate bands, this suffix will be added (character vector).

Value

merged data sets (tibble of class "sits" or tibble of class "raster_cube")

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # Retrieve a time series with values of NDVI
    point_ndvi <- sits_select(point_mt_6bands, bands = "NDVI")

    # Filter the point using the Whittaker smoother
    point_whit <- sits_filter(point_ndvi, sits_whittaker(lambda = 3.0))
    # Merge time series
    point_ndvi <- sits_merge(point_ndvi, point_whit, suffix = c("", ".WHIT"))

    # Plot the two points to see the smoothing effect
    plot(point_ndvi)
}
```

---

sits_mgrs_to_roi *Convert MGRS tile information to ROI in WGS84*

Description

Takes a list of MGRS tiles and produces a ROI covering them

Usage

```
sits_mgrs_to_roi(tiles)
```

Arguments

tiles	Character vector with names of MGRS tiles

Value

roi Valid ROI to use in other SITS functions

`sits_mixture_model` *Multiple endmember spectral mixture analysis*

Description

Create a multiple endmember spectral mixture analyses fractions images. We use the non-negative least squares (NNLS) solver to calculate the fractions of each endmember. The NNLS was implemented by Jakob Schwalb-Willmann in RStoolbox package (licensed as GPL>=3).

Usage

```
sits_mixture_model(data, endmembers, ...)

## S3 method for class 'sits'
sits_mixture_model(
  data,
  endmembers,
  ...,
  rmse_band = TRUE,
  multicores = 2,
  progress = TRUE
)

## S3 method for class 'raster_cube'
sits_mixture_model(
  data,
  endmembers,
  ...,
  rmse_band = TRUE,
  memsize = 4,
  multicores = 2,
  output_dir,
  progress = TRUE
)

## S3 method for class 'derived_cube'
sits_mixture_model(data, endmembers, ...)

## S3 method for class 'tbl_df'
sits_mixture_model(data, endmembers, ...)

## Default S3 method:
sits_mixture_model(data, endmembers, ...)
```

Arguments

`data`	A sits data cube or a sits tibble.

endmembers	Reference spectral endmembers. (see details below).
...	Parameters for specific functions.
rmse_band	A boolean indicating whether the error associated with the linear model should be generated. If true, a new band with errors for each pixel is generated using the root mean square measure (RMSE). Default is TRUE.
multicores	Number of cores to be used for generate the mixture model.
progress	Show progress bar? Default is TRUE.
memsize	Memory available for the mixture model (in GB).
output_dir	Directory for output images.

Details

The endmembers parameter should be a tibble, csv or a shapefile. endmembers parameter must have the following columns: type, which defines the endmembers that will be created and the columns corresponding to the bands that will be used in the mixture model. The band values must follow the product scale. For example, in the case of sentinel-2 images the bands should be in the range 0 to 1. See the example in this documentation for more details.

Value

In case of a cube, a sits cube with the fractions of each endmember will be returned. The sum of all fractions is restricted to 1 (scaled from 0 to 10000), corresponding to the abundance of the endmembers in the pixels. In case of a tibble sits, the time series will be returned with the values corresponding to each fraction.

Examples

```
if (sits_run_examples()) {
    # Create a sentinel-2 cube
    s2_cube <- sits_cube(
        source = "AWS",
        collection = "SENTINEL-2-L2A",
        tiles = "20LKP",
        bands = c("B02", "B03", "B04", "B8A", "B11", "B12", "CLOUD"),
        start_date = "2019-06-13",
```

```
    end_date = "2019-06-30"
)
# create a directory to store the regularized file
reg_dir <- paste0(tempdir(), "/mix_model")
dir.create(reg_dir)
# Cube regularization for 16 days and 160 meters
reg_cube <- sits_regularize(
    cube = s2_cube,
    period = "P16D",
    res = 160,
    roi = c(
        lon_min = -65.54870165,
        lat_min = -10.63479162,
        lon_max = -65.07629670,
        lat_max = -10.36046639
    ),
    multicores = 2,
    output_dir = reg_dir
)

# Create the endmembers tibble
em <- tibble::tribble(
    ~class, ~B02, ~B03, ~B04, ~B8A, ~B11, ~B12,
    "forest", 0.02, 0.0352, 0.0189, 0.28, 0.134, 0.0546,
    "land", 0.04, 0.065, 0.07, 0.36, 0.35, 0.18,
    "water", 0.07, 0.11, 0.14, 0.085, 0.004, 0.0026
)

# Generate the mixture model
mm <- sits_mixture_model(
    data = reg_cube,
    endmembers = em,
    memsize = 4,
    multicores = 2,
    output_dir = tempdir()
)
}
```

`sits_mlp` *Train multi-layer perceptron models using torch*

Description

Use a multi-layer perceptron algorithm to classify data. This function uses the R "torch" and "luz" packages. Please refer to the documentation of those package for more details.

Usage

```
sits_mlp(
```

```
  samples = NULL,
  samples_validation = NULL,
  layers = c(512, 512, 512),
  dropout_rates = c(0.2, 0.3, 0.4),
  optimizer = torch::optim_adamw,
  opt_hparams = list(lr = 0.001, eps = 1e-08, weight_decay = 1e-06),
  epochs = 100,
  batch_size = 64,
  validation_split = 0.2,
  patience = 20,
  min_delta = 0.01,
  verbose = FALSE
)
```

Arguments

`samples`	Time series with the training samples.
`samples_validation`	Time series with the validation samples. if the `samples_validation` parameter is provided, the `validation_split` parameter is ignored.
`layers`	Vector with number of hidden nodes in each layer.
`dropout_rates`	Vector with the dropout rates (0,1) for each layer.
`optimizer`	Optimizer function to be used.
`opt_hparams`	Hyperparameters for optimizer: lr : Learning rate of the optimizer eps: Term added to the denominator to improve numerical stability.. weight_decay: L2 regularization
`epochs`	Number of iterations to train the model.
`batch_size`	Number of samples per gradient update.
`validation_split`	Number between 0 and 1. Fraction of the training data for validation. The model will set apart this fraction and will evaluate the loss and any model metrics on this data at the end of each epoch.
`patience`	Number of epochs without improvements until training stops.
`min_delta`	Minimum improvement in loss function to reset the patience counter.
`verbose`	Verbosity mode (TRUE/FALSE). Default is FALSE.

Value

A torch mlp model to be used for classification.

Note

The default parameters for the MLP have been chosen based on the work by Wang et al. 2017 that takes multilayer perceptrons as the baseline for time series classifications: (a) Three layers with 512 neurons each, specified by the parameter 'layers'; (b) dropout rates of 10 (c) the "optimizer_adam" as optimizer (default value); (d) a number of training steps ('epochs') of 100; (e) a 'batch_size' of 64, which indicates how many time series are used for input at a given steps; (f) a validation percentage of 20 will be randomly set side for validation. (g) The "relu" activation function.

Examples

```
if (sits_run_examples()) {
    # create an MLP model
    torch_model <- sits_train(samples_modis_ndvi,
           sits_mlp(epochs = 20, verbose = TRUE))
    # plot the model
    plot(torch_model)
    # create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # classify a data cube
    probs_cube <- sits_classify(
        data = cube, ml_model = torch_model, output_dir = tempdir()
    )
    # plot the probability cube
    plot(probs_cube)
    # smooth the probability cube using Bayesian statistics
    bayes_cube <- sits_smooth(probs_cube, output_dir = tempdir())
    # plot the smoothed cube
    plot(bayes_cube)
    # label the probability cube
    label_cube <- sits_label_classification(
        bayes_cube,
        output_dir = tempdir()
    )
    # plot the labelled cube
    plot(label_cube)
}
```

---

sits_model_export *Export classification models*

Description

Given a trained machine learning or deep learning model, exports the model as an object for further exploration outside the `sits` package.

Usage

```
sits_model_export(ml_model)

## S3 method for class 'sits_model'
sits_model_export(ml_model)
```

Arguments

ml_model	A trained machine learning model

Value

An R object containing the model in the original format of machine learning or deep learning package.

Author(s)

Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
if (sits_run_examples()) {
    # create a classification model
    rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
    # export the model
    rfor_object <- sits_model_export(rfor_model)
}
```

---

sits_mosaic *Mosaic classified cubes*

Description

Creates a mosaic of all tiles of a sits cube. Mosaics can be created from EO cubes and derived cubes. In sits EO cubes, the mosaic will be generated for each band and date. It is recommended to filter the image with the less cloud cover to create a mosaic for the EO cubes. It is possible to provide a roi to crop the mosaic.

Usage

```
sits_mosaic(
  cube,
  crs = "EPSG:3857",
  roi = NULL,
  multicores = 2,
  output_dir,
  version = "v1",
```

```
  progress = TRUE
)
```

Arguments

cube	A sits data cube.
crs	A target coordinate reference system of raster mosaic. The provided crs could be a string (e.g, "EPSG:4326" or a proj4string), or an EPSG code number (e.g. 4326). Default is "EPSG:3857" - WGS 84 / Pseudo-Mercator.
roi	Region of interest (see below).
multicores	Number of cores that will be used to crop the images in parallel.
output_dir	Directory for output images.
version	Version of resulting image (in the case of multiple tests)
progress	Show progress bar? Default is TRUE.

Value

a sits cube with only one tile.

Note

The "roi" parameter defines a region of interest. It can be an sf_object, a shapefile, or a bounding box vector with named XY values (xmin, xmax, ymin, ymax) or named lat/long values (lon_min, lon_max, lat_min, lat_max).

The user should specify the crs of the mosaic since in many cases the input images will be in different coordinate systems. For example, when mosaicking Sentinel-2 images the inputs will be in general in different UTM grid zones.

Examples

```
if (sits_run_examples()) {
    # create a random forest model
    rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
    # create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # classify a data cube
    probs_cube <- sits_classify(
        data = cube, ml_model = rfor_model, output_dir = tempdir()
```

```
    )
    # smooth the probability cube using Bayesian statistics
    bayes_cube <- sits_smooth(probs_cube, output_dir = tempdir())
    # label the probability cube
    label_cube <- sits_label_classification(
        bayes_cube,
        output_dir = tempdir()
    )
    # create roi
    roi <- sf::st_sfc(
        sf::st_polygon(
            list(rbind(
                c(-55.64768, -11.68649),
                c(-55.69654, -11.66455),
                c(-55.62973, -11.61519),
                c(-55.64768, -11.68649)
            ))
        ),
        crs = "EPSG:4326"
    )
    # crop and mosaic classified image
    mosaic_cube <- sits_mosaic(
        cube = label_cube,
        roi = roi,
        crs = "EPSG:4326",
        output_dir = tempdir()
    )
}
```

`sits_patterns` *Find temporal patterns associated to a set of time series*

Description

This function takes a set of time series samples as input estimates a set of patterns. The patterns are calculated using a GAM model. The idea is to use a formula of type y ~ s(x), where x is a temporal reference and y if the value of the signal. For each time, there will be as many predictions as there are sample values. The GAM model predicts a suitable approximation that fits the assumptions of the statistical model, based on a smooth function.

This method is based on the "createPatterns" method of the dtwSat package, which is also described in the reference paper.

Usage

```
sits_patterns(data = NULL, freq = 8, formula = y ~ s(x), ...)
```

Arguments

data	Time series.
freq	Interval in days for estimates.
formula	Formula to be applied in the estimate.
...	Any additional parameters.

Value

Time series with patterns.

sits_predictors *Obtain predictors for time series samples*

Description

Predictors are X-Y values required for machine learning algorithms, organized as a data table where each row corresponds to a training sample. The first two columns of the predictors table are categorical (label_id and label). The other columns are the values of each band and time, organized first by band and then by time.

Usage

```
sits_predictors(samples)
```

Arguments

samples	Time series in sits format (tibble of class "sits")

Value

The predictors for the sample: a data.frame with one row per sample.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    pred <- sits_predictors(samples_modis_ndvi)
}
```

---

sits_pred_features *Obtain numerical values of predictors for time series samples*

Description

Predictors are X-Y values required for machine learning algorithms, organized as a data table where each row corresponds to a training sample. The first two columns of the predictors table are categorical ("label_id" and "label"). The other columns are the values of each band and time, organized first by band and then by time. This function returns the numeric values associated to each sample.

Usage

```
sits_pred_features(pred)
```

Arguments

pred	X-Y predictors: a data.frame with one row per sample.

Value

The Y predictors for the sample: data.frame with one row per sample.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    pred <- sits_predictors(samples_modis_ndvi)
    features <- sits_pred_features(pred)
}
```

`sits_pred_normalize` *Normalize predictor values*

Description

Most machine learning algorithms require data to be normalized. This applies to the "SVM" method and to all deep learning ones. To normalize the predictors, it is required that the statistics per band for each sample have been obtained by the "sits_stats" function.

Usage

```
sits_pred_normalize(pred, stats)
```

Arguments

`pred`	X-Y predictors: a data.frame with one row per sample.
`stats`	Values of time series for Q02 and Q98 of the data (list of numeric values with two elements)

Value

A data.frame with normalized predictor values

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Gilberto Camara, `<gilberto.camara@inpe.br>`

Examples

```
if (sits_run_examples()) {
    stats <- sits_stats(samples_modis_ndvi)
    pred <- sits_predictors(samples_modis_ndvi)
    pred_norm <- sits_pred_normalize(pred, stats)
}
```

sits_pred_reference *Obtain categorical id and predictor labels for time series samples*

Description

Predictors are X-Y values required for machine learning algorithms, organized as a data table where each row corresponds to a training sample. The first two columns of the predictors table are categorical ("label_id" and "label"). The other columns are the values of each band and time, organized first by band and then by time. This function returns the numeric values associated to each sample.

Usage

```
sits_pred_references(pred)
```

Arguments

pred	X-Y predictors: a data.frame with one row per sample.

Value

A character vector with labels associated to training samples.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    pred <- sits_predictors(samples_modis_ndvi)
    ref <- sits_pred_references(pred)
}
```

sits_pred_sample *Obtain a fraction of the predictors data frame*

Description

Many machine learning algorithms (especially deep learning) use part of the original samples as test data to adjust its hyperparameters and to find an optimal point of convergence using gradient descent. This function extracts a fraction of the predictors to serve as test values for the deep learning algorithm.

Usage

```
sits_pred_sample(pred, frac)
```

Arguments

pred	X-Y predictors: a data.frame with one row per sample.
frac	Fraction of the X-Y predictors to be extracted

Value

A data.frame with the chosen fraction of the X-Y predictors.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    pred <- sits_predictors(samples_modis_ndvi)
    pred_frac <- sits_pred_sample(pred, frac = 0.5)
}
```

---

sits_reclassify *Reclassify a classified cube*

Description

Apply a set of named expressions to reclassify a classified image. The expressions should use character values to refer to labels in logical expressions.

Usage

```
sits_reclassify(cube, ...)

## S3 method for class 'class_cube'
sits_reclassify(
  cube,
  ...,
  mask,
  rules,
  memsize = 4L,
  multicores = 2L,
  output_dir,
  version = "v1"
)
```

```
## Default S3 method:
sits_reclassify(cube, ...)
```

Arguments

cube	Image cube to be reclassified (class = "class_cube")
...	Other parameters for specific functions.
mask	Image cube with additional information to be used in expressions (class = "class_cube").
rules	Expressions to be evaluated (named list).
memsize	Memory available for classification in GB (integer, min = 1, max = 16384).
multicores	Number of cores to be used for classification (integer, min = 1, max = 2048).
output_dir	Directory where files will be saved (character vector of length 1 with valid location).
version	Version of resulting image (character).

Details

sits_reclassify() allow any valid R expression to compute reclassification. User should refer to cube and mask to construct logical expressions. Users can use can use any R expression that evaluates to logical. TRUE values will be relabeled to expression name. Updates are done in asynchronous manner, that is, all expressions are evaluated using original classified values. Expressions are evaluated sequentially and resulting values are assigned to output cube. Last expressions has precedence over first ones.

Value

An object of class "class_cube" (reclassified cube).

)
}
```

`sits_reduce` *Reduces a cube or samples from a summarization function*

Description

Apply a temporal reduction from a named expression in cube or sits tibble. In the case of cubes, it materializes a new band in `output_dir`. The result will be a cube with only one date with the raster reduced from the function.

Usage

```
sits_reduce(data, ...)

## S3 method for class 'sits'
sits_reduce(data, ...)

## S3 method for class 'raster_cube'
sits_reduce(
  data,
  ...,
  impute_fn = impute_linear(),
  memsize = 4L,
  multicores = 2L,
  output_dir,
  progress = FALSE
)
```

Arguments

`data`	Valid sits tibble or cube
`...`	Named expressions to be evaluated (see details).
`impute_fn`	Imputation function to remove NA values.
`memsize`	Memory available for classification (in GB).
`multicores`	Number of cores to be used for classification.
`output_dir`	Directory where files will be saved.
`progress`	Show progress bar?

Details

`sits_reduce()` allows valid R expression to compute new bands. Use R syntax to pass an expression to this function. Besides arithmetic operators, you can use virtually any R function that can be applied to elements of a matrix. The provided functions must operate at line level in order to perform temporal reduction on a pixel.

`sits_reduce()` Applies a function to each row of a matrix. In this matrix, each row represents a pixel and each column represents a single date. We provide some operations already implemented in the package to perform the reduce operation. See the list of available functions below:

Value

A sits tibble or a sits cube with new bands, produced according to the requested expression.

Summarizing temporal functions

- `t_max()`: Returns the maximum value of the series.
- `t_min()`: Returns the minimum value of the series
- `t_mean()`: Returns the mean of the series.
- `t_median()`: Returns the median of the series.
- `t_sum()`: Returns the sum of all the points in the series.
- `t_std()`: Returns the standard deviation of the series.
- `t_skewness()`: Returns the skewness of the series.
- `t_kurtosis()`: Returns the kurtosis of the series.
- `t_amplitude()`: Returns the difference between the maximum and minimum values of the cycle. A small amplitude means a stable cycle.
- `t_fslope()`: Returns the maximum value of the first slope of the cycle. Indicates when the cycle presents an abrupt change in the curve. The slope between two values relates the speed of the growth or senescence phases
- `t_mse()`: Returns the average spectral energy density. The energy of the time series is distributed by frequency.
- `t_fqr()`: Returns the value of the first quartile of the series (0.25).
- `t_tqr()`: Returns the value of the third quartile of the series (0.75).
- `t_iqr()`: Returns the interquartile range (difference between the third and first quartiles).

Note

The `t_sum()`, `t_std()`, `t_skewness()`, `t_kurtosis`, `t_mse` indexes generate values greater than the limit of a two-byte integer. Therefore, we save the images generated by these as Float-32 with no scale.

Examples

```
if (sits_run_examples()) {
    # Reduce summarization function

    point2 <-
        sits_select(point_mt_6bands, "NDVI") |>
        sits_reduce(NDVI_MEDIAN = t_median(NDVI))

    # Example of generation mean summarization from a cube
    # Create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )

    # Reduce NDVI band with mean function
    cube_mean <- sits_reduce(
        data = cube,
        NDVIMEAN = t_mean(NDVI),
        output_dir = tempdir()
    )
}
```

`sits_reduce_imbalance` *Reduce imbalance in a set of samples*

Description

Takes a sits tibble with different labels and returns a new tibble. Deals with class imbalance using the synthetic minority oversampling technique (SMOTE) for oversampling. Undersampling is done using the SOM methods available in the sits package.

Usage

```
sits_reduce_imbalance(
  samples,
  n_samples_over = 200,
  n_samples_under = 400,
  method = "smote",
  multicores = 2
)
```

Arguments

`samples`	Sample set to rebalance

n_samples_over	Number of samples to oversample for classes with samples less than this number.
n_samples_under	Number of samples to undersample for classes with samples more than this number.
method	Method for oversampling (default = "smote")
multicores	Number of cores to process the data (default 2).

Value

A sits tibble with reduced sample imbalance.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

References

The reference paper on SMOTE is N. V. Chawla, K. W. Bowyer, L. O.Hall, W. P. Kegelmeyer, "SMOTE: synthetic minority over-sampling technique," Journal of artificial intelligence research, 321-357, 2002.

Undersampling uses the SOM map developed by Lorena Santos and co-workers and used in the sits_som_map() function. The SOM map technique is described in the paper: Lorena Santos, Karine Ferreira, Gilberto Camara, Michelle Picoli, Rolf Simoes, "Quality control and class noise reduction of satellite image time series". ISPRS Journal of Photogrammetry and Remote Sensing, vol. 177, pp 75-88, 2021. https://doi.org/10.1016/j.isprsjprs.2021.04.014.

Examples

```
if (sits_run_examples()) {
    # print the labels summary for a sample set
    summary(samples_modis_ndvi)
    # reduce the sample imbalance
    new_samples <- sits_reduce_imbalance(samples_modis_ndvi,
        n_samples_over = 200,
        n_samples_under = 200,
        multicores = 1
    )
    # print the labels summary for the rebalanced set
    summary(new_samples)
}
```

`sits_regularize` *Build a regular data cube from an irregular one*

Description

Produces regular data cubes for analysis-ready data (ARD) image collections. Analysis-ready data (ARD) collections available in AWS, MPC, USGS and DEAfrica are not regular in space and time. Bands may have different resolutions, images may not cover the entire time, and time intervals are not regular. For this reason, subsets of these collection need to be converted to regular data cubes before further processing and data analysis. This function requires users to include the cloud band in their ARD-based data cubes.

Usage

```
sits_regularize(cube, ...)

## S3 method for class 'raster_cube'
sits_regularize(
  cube,
  ...,
  period,
  res,
  output_dir,
  timeline = NULL,
  roi = NULL,
  tiles = NULL,
  grid_system = NULL,
  multicores = 2L,
  progress = TRUE
)

## S3 method for class 'sar_cube'
sits_regularize(
  cube,
  ...,
  period,
  res,
  output_dir,
  timeline = NULL,
  grid_system = "MGRS",
  roi = NULL,
  tiles = NULL,
  multicores = 2L,
  progress = TRUE
)

## S3 method for class 'combined_cube'
```

```
sits_regularize(
  cube,
  ...,
  period,
  res,
  output_dir,
  grid_system = NULL,
  roi = NULL,
  tiles = NULL,
  multicores = 2L,
  progress = TRUE
)

## S3 method for class 'rainfall_cube'
sits_regularize(
  cube,
  ...,
  period,
  res,
  output_dir,
  timeline = NULL,
  grid_system = "MGRS",
  roi = NULL,
  tiles = NULL,
  multicores = 2L,
  progress = TRUE
)

## S3 method for class 'dem_cube'
sits_regularize(
  cube,
  ...,
  res,
  output_dir,
  grid_system = "MGRS",
  roi = NULL,
  tiles = NULL,
  multicores = 2L,
  progress = TRUE
)

## S3 method for class 'derived_cube'
sits_regularize(cube, ...)

## Default S3 method:
sits_regularize(cube, ...)
```

Arguments

cube	raster_cube object whose observation period and/or spatial resolution is not constant.
...	Additional parameters.
period	ISO8601-compliant time period for regular data cubes, with number and unit, where "D", "M" and "Y" stand for days, month and year; e.g., "P16D" for 16 days.
res	Spatial resolution of regularized images (in meters).
output_dir	Valid directory for storing regularized images.
timeline	User-defined timeline for regularized cube.
roi	A named numeric vector with a region of interest.
tiles	Tiles to be produced.
grid_system	A character with the grid system that images will be cropped.
multicores	Number of cores used for regularization; used for parallel processing of input (integer)
progress	show progress bar?

Value

A raster_cube object with aggregated images.

Note

The "period" parameter is mandatory, and defines the time interval between two images of the regularized cube. By default, the date of the first image of the input cube is taken as the starting date for the regular cube. In many situations, users may want to pre-define the required times using the "timeline" parameter. The "timeline" parameter, if used, must contain a set of dates which are compatible with the input cube.

The optional "roi" parameter defines a region of interest. It can be an sf_object, a shapefile, or a bounding box vector with named XY values ("xmin", "xmax", "ymin", "ymax") or named lat/long values ("lat_min", "lat_max", "long_min", "long_max"). sits_regularize() function will crop the images that contain the region of interest().

The optional "tiles" parameter indicates which tiles of the input cube will be used for regularization.

The "grid_system" parameters allows the choice of grid system for the regularized cube. Currently, the package supports the use of MGRS grid system and those used by the Brazil Data Cube ("BDC_LG_V2" "BDC_MD_V2" "BDC_SM_V2").

The aggregation method used in sits_regularize sorts the images based on cloud cover, where images with the fewest clouds at the top of the stack. Once the stack of images is sorted, the method uses the first valid value to create the temporal aggregation.

The input (non-regular) ARD cube needs to include the cloud band for the regularization to work.

Examples

```
if (sits_run_examples()) {
    # define a non-regular Sentinel-2 cube in AWS
    s2_cube_open <- sits_cube(
        source = "AWS",
        collection = "SENTINEL-2-L2A",
        tiles = c("20LKP", "20LLP"),
        bands = c("B8A", "CLOUD"),
        start_date = "2018-10-01",
        end_date = "2018-11-01"
    )
    # regularize the cube
    rg_cube <- sits_regularize(
        cube = s2_cube_open,
        period = "P16D",
        res = 60,
        multicores = 2,
        output_dir = tempdir()
    )

    ## Sentinel-1 SAR
    roi <- c("lon_min" = -50.410, "lon_max" = -50.379,
             "lat_min" = -10.1910, "lat_max" = -10.1573)
    s1_cube_open <- sits_cube(
        source = "MPC",
        collection = "SENTINEL-1-GRD",
        bands = c("VV", "VH"),
        orbit = "descending",
        roi = roi,
        start_date = "2020-06-01",
        end_date = "2020-09-28"
    )
    # regularize the cube
    rg_cube <- sits_regularize(
        cube = s1_cube_open,
        period = "P12D",
        res = 60,
        roi = roi,
        multicores = 2,
        output_dir = tempdir()
    )
}
```

`sits_rfor` *Train random forest models*

Description

Use Random Forest algorithm to classify samples. This function is a front-end to the `randomForest` package. Please refer to the documentation in that package for more details.

Usage

```
sits_rfor(samples = NULL, num_trees = 100, mtry = NULL, ...)
```

Arguments

samples	Time series with the training samples (tibble of class "sits").
num_trees	Number of trees to grow. This should not be set to too small a number, to ensure that every input row gets predicted at least a few times (default: 100) (integer, min = 50, max = 150).
mtry	Number of variables randomly sampled as candidates at each split (default: NULL - use default value of `randomForest::randomForest()` function, i.e. `floor(sqrt(features))`).
...	Other parameters to be passed to 'randomForest::randomForest' function.

Value

Model fitted to input data (to be passed to `sits_classify`).

Author(s)

Alexandre Ywata de Carvalho, <alexandre.ywata@ipea.gov.br>

Rolf Simoes, <rolf.simoes@inpe.br>

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # Example of training a model for time series classification
    # Retrieve the samples for Mato Grosso
    # train a random forest model
    rf_model <- sits_train(samples_modis_ndvi,
        ml_method = sits_rfor
    )
    # classify the point
    point_ndvi <- sits_select(point_mt_6bands, bands = "NDVI")
    # classify the point
    point_class <- sits_classify(
        data = point_ndvi, ml_model = rf_model
    )
    plot(point_class)
}
```

sits_run_examples *Informs if sits examples should run*

Description

This function informs if sits examples should run. To run the examples, set "SITS_RUN_EXAMPLES" to "YES" using Sys.setenv("SITS_RUN_EXAMPLES" = "YES") To come back to the default behaviour, please set Sys.setenv("SITS_RUN_EXAMPLES" = "NO")

Usage

```
sits_run_examples()
```

Value

A logical value

sits_run_tests *Informs if sits tests should run*

Description

To run the tests, set "SITS_RUN_TESTS" environment to "YES" using Sys.setenv("SITS_RUN_TESTS" = "YES") To come back to the default behaviour, please set Sys.setenv("SITS_RUN_TESTS" = "NO")

Usage

```
sits_run_tests()
```

Value

TRUE/FALSE

sits_sample *Sample a percentage of a time series*

Description

Takes a sits tibble with different labels and returns a new tibble. For a given field as a group criterion, this new tibble contains a percentage of the total number of samples per group. If frac > 1 , all sampling will be done with replacement.

Usage

```
sits_sample(data, frac = 0.2, oversample = TRUE)
```

Arguments

data	Sits time series tibble (class = "sits")
frac	Percentage of samples to extract (range: 0.0 to 2.0, default = 0.2)
oversample	Logical: oversample classes with small number of samples? (TRUE/FALSE)

Value

A sits tibble with a fixed quantity of samples.

Author(s)

Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
# Retrieve a set of time series with 2 classes
data(cerrado_2classes)
# Print the labels of the resulting tibble
summary(cerrado_2classes)
# Sample by fraction
data_02 <- sits_sample(cerrado_2classes, frac = 0.2)
# Print the labels
summary(data_02)
```

`sits_sampling_design` *Allocation of sample size to strata*

Description

Takes a class cube with different labels and allocates a number of sample sizes per strata to obtain suitable values of error-adjusted area, providing five allocation strategies.

Usage

```
sits_sampling_design(
  cube,
  expected_ua = 0.75,
  alloc_options = c(100, 75, 50),
  std_err = 0.01,
  rare_class_prop = 0.1
)
```

Arguments

`cube`	Classified cube
`expected_ua`	Expected values of user's accuracy
`alloc_options`	Fixed sample allocation for rare classes
`std_err`	Standard error we would like to achieve
`rare_class_prop`	Proportional area limit for rare classes

Value

A matrix with options to decide allocation of sample size to each class. This matrix uses the same format as Table 5 of Olofsson et al.(2014).

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # create a random forest model
    rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
    # create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # classify a data cube
    probs_cube <- sits_classify(
        data = cube, ml_model = rfor_model, output_dir = tempdir()
    )
    # label the probability cube
    label_cube <- sits_label_classification(
        probs_cube,
        output_dir = tempdir()
    )
    # estimated UA for classes
    expected_ua <- c(Cerrado = 0.75, Forest = 0.9,
                     Pasture = 0.8, Soy_Corn = 0.8)
    sampling_design <- sits_sampling_design(label_cube, expected_ua)
}
```

`sits_segment` *Segment an image*

Description

Apply a spatial-temporal segmentation on a data cube based on a user defined segmentation function. The function applies the segmentation algorithm "seg_fn" to each tile.

Segmentation uses the following steps:

1. Create a regular data cube with `sits_cube` and `sits_regularize`;
2. Run `sits_segment` to obtain a vector data cube with polygons that define the boundary of the segments;
3. Classify the time series associated to the segments with `sits_classify`, to get obtain a vector probability cube;
4. Use `sits_label_classification` to label the vector probability cube;
5. Display the results with `plot` or `sits_view`.

Usage

```
sits_segment(
  cube,
  seg_fn = sits_slic(),
  roi = NULL,
  impute_fn = impute_linear(),
  start_date = NULL,
  end_date = NULL,
  memsize = 1,
  multicores = 1,
  output_dir,
  version = "v1",
  progress = TRUE
)
```

Arguments

cube	Regular data cube
seg_fn	Function to apply the segmentation
roi	Region of interest (see below)
impute_fn	Imputation function to remove NA values.
start_date	Start date for the segmentation
end_date	End date for the segmentation.
memsize	Memory available for classification (in GB).
multicores	Number of cores to be used for classification.
output_dir	Directory for output file.
version	Version of the output (for multiple segmentations).
progress	Show progress bar?

Value

A tibble of class 'segs_cube' representing the segmentation.

Note

The "roi" parameter defines a region of interest. It can be an sf_object, a shapefile, or a bounding box vector with named XY values ("xmin", "xmax", "ymin", "ymax") or named lat/long values ("lon_min", "lat_min", "lon_max", "lat_max")

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Rolf Simoes, <rolf.simoes@inpe.br>

Felipe Carvalho, <felipe.carvalho@inpe.br>

Examples

```
if (sits_run_examples()) {
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    # create a data cube
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # segment the vector cube
    segments <- sits_segment(
        cube = cube,
        output_dir = tempdir()
    )
    # create a classification model
    rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
    # classify the segments
    seg_probs <- sits_classify(
        data = segments,
        ml_model = rfor_model,
        output_dir = tempdir()
    )
    # label the probability segments
    seg_label <- sits_label_classification(
        cube = seg_probs,
        output_dir = tempdir()
    )
}
```

---

sits_select *Filter bands on a data set (tibble or cube)*

Description

Filter only the selected bands and dates from a set of time series or from a data cube.

Usage

```
sits_select(data, ...)

## S3 method for class 'sits'
sits_select(data, ..., bands = NULL, start_date = NULL, end_date = NULL)

## S3 method for class 'raster_cube'
sits_select(
  data,
  ...,
  bands = NULL,
  start_date = NULL,
```

```
  end_date = NULL,
  dates = NULL,
  tiles = NULL
)

## Default S3 method:
sits_select(data, ...)
```

Arguments

data	Tibble with time series or data cube.
...	Additional parameters to be provided
bands	Character vector with the names of the bands.
start_date	Date in YYYY-MM-DD format: start date to be filtered.
end_date	Date in YYYY-MM-DD format: end date to be filtered.
dates	Character vector with sparse dates to select.
tiles	Character vector with the names of the tiles.

Value

Tibble with time series or data cube.

Author(s)

Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
# Retrieve a set of time series with 2 classes
data(cerrado_2classes)
# Print the original bands
sits_bands(cerrado_2classes)
# Select only the NDVI band
data <- sits_select(cerrado_2classes, bands = c("NDVI"))
# Print the labels of the resulting tibble
sits_bands(data)
# select start and end date
point_2010 <- sits_select(point_mt_6bands,
              start_date = "2000-01-01",
              end_date = "2030-12-31")
```

sits_sgolay *Filter time series with Savitzky-Golay filter*

Description

An optimal polynomial for warping a time series. The degree of smoothing depends on the filter order (usually 3.0). The order of the polynomial uses the parameter 'order' (default = 3), the size of the temporal window uses the parameter 'length' (default = 5).

Usage

```
sits_sgolay(data = NULL, order = 3, length = 5)
```

Arguments

data	Time series or matrix.
order	Filter order (integer).
length	Filter length (must be odd).

Value

Filtered time series

Author(s)

Rolf Simoes, <rolf.simoes@inpe.br>

Gilberto Camara, <gilberto.camara@inpe.br>

Felipe Carvalho, <felipe.carvalho@inpe.br>

References

A. Savitzky, M. Golay, "Smoothing and Differentiation of Data by Simplified Least Squares Procedures". Analytical Chemistry, 36 (8): 1627–39, 1964.

Examples

```
if (sits_run_examples()) {
    # Retrieve a time series with values of NDVI
    point_ndvi <- sits_select(point_mt_6bands, bands = "NDVI")

    # Filter the point using the Savitzky-Golay smoother
    point_sg <- sits_filter(point_ndvi,
        filter = sits_sgolay(order = 3, length = 5)
    )
    # Merge time series
    point_ndvi <- sits_merge(point_ndvi, point_sg, suffix = c("", ".SG"))
```

```
    # Plot the two points to see the smoothing effect
    plot(point_ndvi)
}
```

`sits_slic` *Segment an image using SLIC*

Description

Apply a segmentation on a data cube based on the `supercells` package. This is an adaptation and extension to remote sensing data of the SLIC superpixels algorithm proposed by Achanta et al. (2012). See references for more details.

Usage

```
sits_slic(
  data = NULL,
  step = 30,
  compactness = 1,
  dist_fun = "euclidean",
  avg_fun = "median",
  iter = 30,
  minarea = 10,
  verbose = FALSE
)
```

Arguments

`data`	A matrix with time series.
`step`	Distance (in number of cells) between initial supercells' centers.
`compactness`	A compactness value. Larger values cause clusters to be more compact/even (square).
`dist_fun`	Distance function. Currently implemented: `euclidean`, `jsd`, `dtw`, and any distance function from the `philentropy` package. See `philentropy::getDistMethods()`.
`avg_fun`	Averaging function to calculate the values of the supercells' centers. Accepts any fitting R function (e.g., base::mean() or stats::median()) or one of internally implemented "mean" and "median". Default: "median"
`iter`	Number of iterations to create the output.
`minarea`	Specifies the minimal size of a supercell (in cells).
`verbose`	Show the progress bar?

Value

Set of segments for a single tile

```
if (sits_run_examples()) {
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    # create a data cube
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # segment the vector cube
    segments <- sits_segment(
        cube = cube,
        output_dir = tempdir(),
        version = "slic-demo"
    )
    # create a classification model
    rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
    # classify the segments
    seg_probs <- sits_classify(
        data = segments,
        ml_model = rfor_model,
        output_dir = tempdir(),
        version = "slic-demo"
    )
    # label the probability segments
    seg_label <- sits_label_classification(
        cube = seg_probs,
        output_dir = tempdir(),
        version = "slic-demo"
    )
}
```

`sits_smooth` *Smooth probability cubes with spatial predictors*

Description

Takes a set of classified raster layers with probabilities, whose metadata is]created by `sits_cube`, and applies a Bayesian smoothing function.

Usage

```
sits_smooth(cube, ...)

## S3 method for class 'probs_cube'
sits_smooth(
  cube,
  ...,
  window_size = 9L,
  neigh_fraction = 0.5,
  smoothness = 20L,
  exclusion_mask = NULL,
  memsize = 4L,
  multicores = 2L,
  output_dir,
  version = "v1"
)

## S3 method for class 'probs_vector_cube'
sits_smooth(cube, ...)

## S3 method for class 'raster_cube'
sits_smooth(cube, ...)

## S3 method for class 'derived_cube'
sits_smooth(cube, ...)

## Default S3 method:
sits_smooth(cube, ...)
```

Arguments

`cube`	Probability data cube.
`...`	Other parameters for specific functions.
`window_size`	Size of the neighborhood (integer, min = 3, max = 21)
`neigh_fraction`	Fraction of neighbors with high probabilities to be used in Bayesian inference. (numeric, min = 0.1, max = 1.0)

smoothness	Estimated variance of logit of class probabilities (Bayesian smoothing parameter) (integer vector or scalar, min = 1, max = 200).
exclusion_mask	Areas to be excluded from the classification process. It can be defined as a sf object or a shapefile.
memsize	Memory available for classification in GB (integer, min = 1, max = 16384).
multicores	Number of cores to be used for classification (integer, min = 1, max = 2048).
output_dir	Valid directory for output file. (character vector of length 1).
version	Version of the output (character vector of length 1).

Value

A data cube.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
if (sits_run_examples()) {
    # create am xgboost model
    xgb_model <- sits_train(samples_modis_ndvi, sits_xgboost())
    # create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # classify a data cube
    probs_cube <- sits_classify(
        data = cube, ml_model = xgb_model, output_dir = tempdir()
    )
    # plot the probability cube
    plot(probs_cube)
    # smooth the probability cube using Bayesian statistics
    bayes_cube <- sits_smooth(probs_cube, output_dir = tempdir())
    # plot the smoothed cube
    plot(bayes_cube)
    # label the probability cube
    label_cube <- sits_label_classification(
        bayes_cube,
        output_dir = tempdir()
    )
    # plot the labelled cube
    plot(label_cube)
}
```

`sits_som` *Use SOM for quality analysis of time series samples*

Description

These function use self-organized maps to perform quality analysis in satellite image time series

`sits_som_map()` creates a SOM map, where high-dimensional data is mapped into a two dimensional map, keeping the topological relations between data patterns. Each sample is assigned to a neuron, and neurons are placed in the grid based on similarity.

`sits_som_evaluate_cluster()` analyses the neurons of the SOM map, and builds clusters based on them. Each cluster is a neuron or a set of neuron categorized with same label. It produces a tibble with the percentage of mixture of classes in each cluster.

`sits_som_clean_samples()` evaluates the quality of the samples based on the results of the SOM map. The algorithm identifies noisy samples, using 'prior_threshold' for the prior probability and 'posterior_threshold' for the posterior probability. Each sample receives an evaluation tag, according to the following rule: (a) If the prior probability is < 'prior_threshold', the sample is tagged as "remove"; (b) If the prior probability is >= 'prior_threshold' and the posterior probability is >='posterior_threshold', the sample is tagged as "clean"; (c) If the prior probability is >= 'posterior_threshold' and the posterior probability is < 'posterior_threshold', the sample is tagged as "analyze" for further inspection. The user can define which tagged samples will be returned using the "keep" parameter, with the following options: "clean", "analyze", "remove".

Usage

```
sits_som_map(
  data,
  grid_xdim = 10,
  grid_ydim = 10,
  alpha = 1,
  rlen = 100,
  distance = "dtw",
  som_radius = 2,
  mode = "online"
)
```

Arguments

`data`	A tibble with samples to be clustered.
`grid_xdim`	X dimension of the SOM grid (default = 25).
`grid_ydim`	Y dimension of the SOM grid.
`alpha`	Starting learning rate (decreases according to number of iterations).
`rlen`	Number of iterations to produce the SOM.
`distance`	The type of similarity measure (distance). The following similarity measurements are supported: `"euclidean"` and `"dtw"`. The default similarity measure is `"dtw"`.

som_radius	Radius of SOM neighborhood.
mode	Type of learning algorithm. The following learning algorithm are available: "online", "batch", and "pbatch". The default learning algorithm is "online".

Value

sits_som_map() produces a list with three members: (1) the samples tibble, with one additional column indicating to which neuron each sample has been mapped; (2) the Kohonen map, used for plotting and cluster quality measures; (3) a tibble with the labelled neurons, where each class of each neuron is associated to two values: (a) the prior probability that this class belongs to a cluster based on the frequency of samples of this class allocated to the neuron; (b) the posterior probability that this class belongs to a cluster, using data for the neighbours on the SOM map.

Note

To learn more about the learning algorithms, check the kohonen::supersom function.

The sits package implements the "dtw" (Dynamic Time Warping) similarity measure. The "euclidean" similarity measurement come from the kohonen::supersom (dist.fcts) function.

References

Lorena Santos, Karine Ferreira, Gilberto Camara, Michelle Picoli, Rolf Simoes, "Quality control and class noise reduction of satellite image time series". ISPRS Journal of Photogrammetry and Remote Sensing, vol. 177, pp 75-88, 2021. https://doi.org/10.1016/j.isprsjprs.2021.04.014.

Examples

```
if (sits_run_examples()) {
    # create a som map
    som_map <- sits_som_map(samples_modis_ndvi)
    # plot the som map
    plot(som_map)
    # evaluate the som map and create clusters
    clusters_som <- sits_som_evaluate_cluster(som_map)
    # plot the cluster evaluation
    plot(clusters_som)
    # clean the samples
    new_samples <- sits_som_clean_samples(som_map)
}
```

`sits_som_clean_samples` *Cleans the samples based on SOM map information*

Description

Cleans the samples based on SOM map information

Usage

```
sits_som_clean_samples(
  som_map,
  prior_threshold = 0.6,
  posterior_threshold = 0.6,
  keep = c("clean", "analyze")
)
```

Arguments

`som_map`	Returned by `sits_som_map`.
`prior_threshold`	Threshold of conditional probability (frequency of samples assigned to the same SOM neuron).
`posterior_threshold`	Threshold of posterior probability (influenced by the SOM neighborhood).
`keep`	Which types of evaluation to be maintained in the data.

Value

tibble with an two additional columns. The first indicates if each sample is clean, should be analyzed or should be removed. The second is the posterior probability of the sample.

Examples

```
if (sits_run_examples()) {
    # create a som map
    som_map <- sits_som_map(samples_modis_ndvi)
    # plot the som map
    plot(som_map)
    # evaluate the som map and create clusters
    clusters_som <- sits_som_evaluate_cluster(som_map)
    # plot the cluster evaluation
    plot(clusters_som)
    # clean the samples
    new_samples <- sits_som_clean_samples(som_map)
}
```

sits_som_evaluate_cluster
Evaluate cluster

Description

sits_som_evaluate_cluster() produces a tibble with the clusters found by the SOM map. For each cluster, it provides the percentage of classes inside it.

Usage

```
sits_som_evaluate_cluster(som_map)
```

Arguments

som_map	A SOM map produced by the som_map() function

Value

A tibble stating the purity for each cluster

Examples

```
if (sits_run_examples()) {
    # create a som map
    som_map <- sits_som_map(samples_modis_ndvi)
    # plot the som map
    plot(som_map)
    # evaluate the som map and create clusters
    clusters_som <- sits_som_evaluate_cluster(som_map)
    # plot the cluster evaluation
    plot(clusters_som)
    # clean the samples
    new_samples <- sits_som_clean_samples(som_map)
}
```

sits_som_remove_samples
Evaluate cluster

Description

Remove samples from a given class inside a neuron of another class

Usage

```
sits_som_remove_samples(som_map, som_eval, class_cluster, class_remove)
```

Arguments

som_map	A SOM map produced by the som_map() function
som_eval	An evaluation produced by the som_eval() function
class_cluster	Dominant class of a set of neurons
class_remove	Class to be removed from the neurons of the "class_cluster"

Value

A new set of samples with the desired class neurons remove

Examples

```
if (sits_run_examples()) {
    # create a som map
    som_map <- sits_som_map(samples_modis_ndvi)
    # evaluate the som map and create clusters
    som_eval <- sits_som_evaluate_cluster(som_map)
    # clean the samples
    new_samples <- sits_som_remove_samples(som_map, som_eval, "Pasture", "Cerrado")
}
```

---

sits_stats *Obtain statistics for all sample bands*

Description

Most machine learning algorithms require data to be normalized. This applies to the "SVM" method and to all deep learning ones. To normalize the predictors, it is necessary to extract the statistics of each band of the samples. This function computes the 2 of the distribution of each band of the samples. This values are used as minimum and maximum values in the normalization operation performed by the sits_pred_normalize() function.

Usage

```
sits_stats(samples)
```

Arguments

samples	Time series samples uses as training data.

Value

A list with the 2 training data.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    stats <- sits_stats(samples_modis_ndvi)
}
```

---

sits_stratified_sampling

Allocation of sample size to strata

Description

Takes a class cube with different labels and a sampling design with a number of samples per class and allocates a set of locations for each class

Usage

```
sits_stratified_sampling(
  cube,
  sampling_design,
  alloc = "alloc_prop",
  overhead = 1.2,
  multicores = 2L,
  shp_file = NULL,
  progress = TRUE
)
```

Arguments

cube	Classified cube
sampling_design	Result of sits_sampling_design
alloc	Allocation method chosen
overhead	Additional percentage to account for border points
multicores	Number of cores that will be used to sample the images in parallel.
shp_file	Name of shapefile to be saved (optional)
progress	Show progress bar? Default is TRUE.

Value

samples Point sf object with required samples

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # create a random forest model
    rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
    # create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # classify a data cube
    probs_cube <- sits_classify(
        data = cube, ml_model = rfor_model, output_dir = tempdir()
    )
    # label the probability cube
    label_cube <- sits_label_classification(
        probs_cube,
        output_dir = tempdir()
    )
    # estimated UA for classes
    expected_ua <- c(Cerrado = 0.95, Forest = 0.95,
                     Pasture = 0.95, Soy_Corn = 0.95)
    # design sampling
    sampling_design <- sits_sampling_design(label_cube, expected_ua)
    # select samples
    samples <- sits_stratified_sampling(label_cube,
                                        sampling_design, "alloc_prop")

}
```

---

sits_svm *Train support vector machine models*

Description

This function receives a tibble with a set of attributes X for each observation Y. These attributes are the values of the time series for each band. The SVM algorithm is used for multiclass-classification. For this purpose, it uses the "one-against-one" approach, in which k(k-1)/2 binary classifiers are trained; the appropriate class is found by a voting scheme. This function is a front-end to the "svm" method in the "e1071" package. Please refer to the documentation in that package for more details.

Usage

```
sits_svm(
  samples = NULL,
  formula = sits_formula_linear(),
  scale = FALSE,
  cachesize = 1000,
  kernel = "radial",
  degree = 3,
  coef0 = 0,
  cost = 10,
  tolerance = 0.001,
  epsilon = 0.1,
  cross = 10,
  ...
)
```

Arguments

samples	Time series with the training samples.
formula	Symbolic description of the model to be fit. (default: sits_formula_linear).
scale	Logical vector indicating the variables to be scaled.
cachesize	Cache memory in MB (default = 1000).
kernel	Kernel used in training and predicting. options: "linear", "polynomial", "radial", "sigmoid" (default: "radial").
degree	Exponential of polynomial type kernel (default: 3).
coef0	Parameter needed for kernels of type polynomial and sigmoid (default: 0).
cost	Cost of constraints violation (default: 10).
tolerance	Tolerance of termination criterion (default: 0.001).
epsilon	Epsilon in the insensitive-loss function (default: 0.1).
cross	Number of cross validation folds applied to assess the quality of the model (default: 10).
...	Other parameters to be passed to e1071::svm function.

Value

Model fitted to input data (to be passed to sits_classify)

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Rolf Simoes, <rolf.simoes@inpe.br>

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # Example of training a model for time series classification
    # Retrieve the samples for Mato Grosso
    # train an SVM model
    ml_model <- sits_train(samples_modis_ndvi, ml_method = sits_svm)
    # classify the point
    point_ndvi <- sits_select(point_mt_6bands, bands = "NDVI")
    # classify the point
    point_class <- sits_classify(
        data = point_ndvi, ml_model = ml_model
    )
    plot(point_class)
}
```

---

sits_tae *Train a model using Temporal Self-Attention Encoder*

Description

Implementation of Temporal Attention Encoder (TAE) for satellite image time series classification.

This function is based on the paper by Vivien Garnot referenced below and code available on github at https://github.com/VSainteuf/pytorch-psetae.

We also used the code made available by Maja Schneider in her work with Marco Körner referenced below and available at https://github.com/maja601/RC2020-psetae.

If you use this method, please cite Garnot's and Schneider's work.

Usage

```
sits_tae(
  samples = NULL,
  samples_validation = NULL,
  epochs = 150,
  batch_size = 64,
  validation_split = 0.2,
  optimizer = torch::optim_adamw,
  opt_hparams = list(lr = 0.001, eps = 1e-08, weight_decay = 1e-06),
  lr_decay_epochs = 1,
  lr_decay_rate = 0.95,
  patience = 20,
  min_delta = 0.01,
  verbose = FALSE
)
```

Arguments

samples	Time series with the training samples.
samples_validation	Time series with the validation samples. if the samples_validation parameter is provided, the validation_split parameter is ignored.
epochs	Number of iterations to train the model.
batch_size	Number of samples per gradient update.
validation_split	Number between 0 and 1. Fraction of training data to be used as validation data.
optimizer	Optimizer function to be used.
opt_hparams	Hyperparameters for optimizer: lr : Learning rate of the optimizer eps: Term added to the denominator to improve numerical stability. weight_decay: L2 regularization
lr_decay_epochs	Number of epochs to reduce learning rate.
lr_decay_rate	Decay factor for reducing learning rate.
patience	Number of epochs without improvements until training stops.
min_delta	Minimum improvement to reset the patience counter.
verbose	Verbosity mode (TRUE/FALSE). Default is FALSE.

Value

A fitted model to be used for classification.

    plot(label_cube)
}
```

`sits_tempcnn` *Train temporal convolutional neural network models*

Description

Use a TempCNN algorithm to classify data, which has two stages: a 1D CNN and a multi-layer perceptron. Users can define the depth of the 1D network, as well as the number of perceptron layers.

This function is based on the paper by Charlotte Pelletier referenced below. If you use this method, please cite the original tempCNN paper.

The torch version is based on the code made available by the BreizhCrops team: Marc Russwurm, Charlotte Pelletier, Marco Korner, Maximilian Zollner. The original python code is available at the website https://github.com/dl4sits/BreizhCrops. This code is licensed as GPL-3.

Usage

```
sits_tempcnn(
  samples = NULL,
  samples_validation = NULL,
  cnn_layers = c(64, 64, 64),
  cnn_kernels = c(5, 5, 5),
  cnn_dropout_rates = c(0.2, 0.2, 0.2),
```

```
  dense_layer_nodes = 256,
  dense_layer_dropout_rate = 0.5,
  epochs = 150,
  batch_size = 64,
  validation_split = 0.2,
  optimizer = torch::optim_adamw,
  opt_hparams = list(lr = 5e-04, eps = 1e-08, weight_decay = 1e-06),
  lr_decay_epochs = 1,
  lr_decay_rate = 0.95,
  patience = 20,
  min_delta = 0.01,
  verbose = FALSE
)
```

Arguments

`samples`	Time series with the training samples.
`samples_validation`	Time series with the validation samples. if the `samples_validation` parameter is provided, the `validation_split` parameter is ignored.
`cnn_layers`	Number of 1D convolutional filters per layer
`cnn_kernels`	Size of the 1D convolutional kernels.
`cnn_dropout_rates`	Dropout rates for 1D convolutional filters.
`dense_layer_nodes`	Number of nodes in the dense layer.
`dense_layer_dropout_rate`	Dropout rate (0,1) for the dense layer.
`epochs`	Number of iterations to train the model.
`batch_size`	Number of samples per gradient update.
`validation_split`	Fraction of training data to be used for validation.
`optimizer`	Optimizer function to be used.
`opt_hparams`	Hyperparameters for optimizer: lr : Learning rate of the optimizer eps: Term added to the denominator to improve numerical stability. weight_decay: L2 regularization
`lr_decay_epochs`	Number of epochs to reduce learning rate.
`lr_decay_rate`	Decay factor for reducing learning rate.
`patience`	Number of epochs without improvements until training stops.
`min_delta`	Minimum improvement in loss function to reset the patience counter.
`verbose`	Verbosity mode (TRUE/FALSE). Default is FALSE.

Value

A fitted model to be used for classification.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

        output_dir = tempdir()
    )
    # plot the labelled cube
    plot(label_cube)
}
```

sits_tiles_to_roi *Convert MGRS tile information to ROI in WGS84*

Description

Takes a list of MGRS tiles and produces a ROI covering them

Usage

```
sits_tiles_to_roi(tiles, grid_system = "MGRS")
```

Arguments

tiles	Character vector with names of MGRS tiles
grid_system	...

Value

roi Valid ROI to use in other SITS functions

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Rolf Simoes, <rolf.simoes@gmail.com>

sits_timeline *Get timeline of a cube or a set of time series*

Description

This function returns the timeline for a given data set, either a set of time series, a data cube, or a trained model.

Usage

```
sits_timeline(data)

## S3 method for class 'sits'
sits_timeline(data)

## S3 method for class 'sits_model'
sits_timeline(data)

## S3 method for class 'raster_cube'
sits_timeline(data)
```

```
## S3 method for class 'derived_cube'
sits_timeline(data)

## S3 method for class 'tbl_df'
sits_timeline(data)

## Default S3 method:
sits_timeline(data)
```

Arguments

data	Tibble of class "sits" or class "raster_cube"

Value

Vector of class Date with timeline of samples or data cube.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
sits_timeline(samples_modis_ndvi)
```

---

sits_timeseries_to_csv

Export a a full sits tibble to the CSV format

Description

Converts metadata and data from a sits tibble to a CSV file. The CSV file will not contain the actual time series. Its columns will be the same as those of a CSV file used to retrieve data from ground information ("latitude", "longitude", "start_date", "end_date", "cube", "label"), plus the all the time series for each data

Usage

```
sits_timeseries_to_csv(data, file = NULL)
```

Arguments

data	Time series (tibble of class "sits").
file	Full path of the exported CSV file (valid file name with extension ".csv").

Value

Return data.frame with CSV columns (optional)

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
csv_file <- paste0(tempdir(), "/cerrado_2classes_ts.csv")
sits_timeseries_to_csv(cerrado_2classes, file = csv_file)
```

---

sits_to_csv *Export a sits tibble metadata to the CSV format*

Description

Converts metadata from a sits tibble to a CSV file. The CSV file will not contain the actual time series. Its columns will be the same as those of a CSV file used to retrieve data from ground information ("latitude", "longitude", "start_date", "end_date", "cube", "label"). If the file is NULL, returns a data.frame as an object

Usage

```
sits_to_csv(data, file = NULL)

## S3 method for class 'sits'
sits_to_csv(data, file = NULL)

## S3 method for class 'tbl_df'
sits_to_csv(data, file)

## Default S3 method:
sits_to_csv(data, file)
```

Arguments

data	Time series (tibble of class "sits").
file	Full path of the exported CSV file (valid file name with extension ".csv").

Value

Return data.frame with CSV columns (optional)

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
csv_file <- paste0(tempdir(), "/cerrado_2classes.csv")
sits_to_csv(cerrado_2classes, file = csv_file)
```

sits_to_xlsx *Save accuracy assessments as Excel files*

Description

Saves confusion matrices as Excel spreadsheets. This function takes the a list of accuracy assessments generated by sits_accuracy and saves them in an Excel spreadsheet.

Usage

```
sits_to_xlsx(acc, file)

## S3 method for class 'sits_accuracy'
sits_to_xlsx(acc, file)

## S3 method for class 'list'
sits_to_xlsx(acc, file)
```

Arguments

acc	Accuracy statistics (either an output of sits_accuracy or a list of those)
file	The file where the XLSX data is to be saved.

Value

No return value, called for side effects.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # A dataset containing a tibble with time series samples
    # for the Mato Grosso state in Brasil
    # create a list to store the results
    results <- list()

    # accuracy assessment lightTAE
    acc_ltae <- sits_kfold_validate(samples_modis_ndvi,
        folds = 5,
        multicores = 1,
```

```
        ml_method = sits_lighttae()
    )
    # use a name
    acc_ltae$name <- "LightTAE"

    # put the result in a list
    results[[length(results) + 1]] <- acc_ltae

    # save to xlsx file
    sits_to_xlsx(
        results,
        file = tempfile("accuracy_mato_grosso_dl_", fileext = ".xlsx")
    )
}
```

`sits_train` *Train classification models*

Description

Given a tibble with a set of distance measures, returns trained models. Currently, sits supports the following models: 'svm' (see `sits_svm`), random forests (see `sits_rfor`), extreme gradient boosting (see `sits_xgboost`), and different deep learning functions, including multi-layer perceptrons (see `sits_mlp`), 1D convolution neural networks `sits_tempcnn`, self-attention encoders `sits_lighttae`

Usage

```
sits_train(samples, ml_method = sits_svm())
```

Arguments

`samples`	Time series with the training samples.
`ml_method`	Machine learning method.

Value

Model fitted to input data to be passed to `sits_classify`

Author(s)

Rolf Simoes, <rolf.simoes@inpe.br>

Gilberto Camara, <gilberto.camara@inpe.br>

Alexandre Ywata de Carvalho, <alexandre.ywata@ipea.gov.br>

Examples

```
if (sits_run_examples()) {
    # Retrieve the set of samples for Mato Grosso
    # fit a training model (rfor model)
    ml_model <- sits_train(samples_modis_ndvi, sits_rfor(num_trees = 50))
    # get a point and classify the point with the ml_model
    point_ndvi <- sits_select(point_mt_6bands, bands = "NDVI")
    class <- sits_classify(
        data = point_ndvi, ml_model = ml_model
    )
}
```

`sits_tuning` *Tuning machine learning models hyper-parameters*

Description

Machine learning models use stochastic gradient descent (SGD) techniques to find optimal solutions. To perform SGD, models use optimization algorithms which have hyperparameters that have to be adjusted to achieve best performance for each application.

This function performs a random search on values of selected hyperparameters. Instead of performing an exhaustive test of all parameter combinations, it selecting them randomly. Validation is done using an independent set of samples or by a validation split. The function returns the best hyperparameters in a list. Hyper-parameters passed to `params` parameter should be passed by calling `sits_tuning_hparams()`.

Usage

```
sits_tuning(
  samples,
  samples_validation = NULL,
  validation_split = 0.2,
  ml_method = sits_tempcnn(),
 params = sits_tuning_hparams(optimizer = torch::optim_adamw, opt_hparams = list(lr =
    loguniform(10^-2, 10^-4))),
  trials = 30,
  multicores = 2,
  gpu_memory = 4,
  batch_size = 2^gpu_memory,
  progress = FALSE
)
```

Arguments

`samples`	Time series set to be validated.
`samples_validation`	Time series set used for validation.

validation_split
: Percent of original time series set to be used for validation (if samples_validation is NULL)

ml_method
: Machine learning method.

params
: List with hyper parameters to be passed to ml_method. User can use uniform, choice, randint, normal, lognormal, loguniform, and beta distribution functions to randomize parameters.

trials
: Number of random trials to perform the random search.

multicores
: Number of cores to process in parallel.

gpu_memory
: Memory available in GPU in GB (default = 4)

batch_size
: Batch size for GPU classification.

progress
: Show progress bar?

Value

A tibble containing all parameters used to train on each trial ordered by accuracy

Note

When using a GPU for deep learning, gpu_memory indicates the memory of the graphics card which is available for processing. The parameter batch_size defines the size of the matrix (measured in number of rows) which is sent to the GPU for classification. Users can test different values of batch_size to find out which one best fits their GPU architecture.

It is not possible to have an exact idea of the size of Deep Learning models in GPU memory, as the complexity of the model and factors such as CUDA Context increase the size of the model in memory. Therefore, we recommend that you leave at least 1GB free on the video card to store the Deep Learning model that will be used.

For users of Apple M3 chips or similar with a Neural Engine, be aware that these chips share memory between the GPU and the CPU. Tests indicate that the memsize should be set to half to the total memory and the batch_size parameter should be a small number (we suggest the value of 64). Be aware that increasing these parameters may lead to memory conflicts.

Examples

```
if (sits_run_examples()) {
    # find best learning rate parameters for TempCNN
    tuned <- sits_tuning(
        samples_modis_ndvi,
```

```
        ml_method = sits_tempcnn(),
        params = sits_tuning_hparams(
            optimizer = choice(
                torch::optim_adamw
            ),
            opt_hparams = list(
                lr = loguniform(10^-2, 10^-4)
            )
        ),
        trials = 4,
        multicores = 2,
        progress = FALSE
    )
    # obtain best accuracy, kappa and best_lr
    accuracy <- tuned$accuracy[[1]]
    kappa <- tuned$kappa[[1]]
    best_lr <- tuned$opt_hparams[[1]]$lr
}
```

`sits_tuning_hparams` *Tuning machine learning models hyper-parameters*

Description

This function allow user building the hyper-parameters space used by `sits_tuning()` function search randomly the best parameter combination.

Users should pass the possible values for hyper-parameters as constants or by calling the following random functions:

- `uniform(min = 0, max = 1, n = 1)`: returns random numbers from a uniform distribution with parameters min and max.
- `choice(..., replace = TRUE, n = 1)`: returns random objects passed to `...` with replacement or not (parameter `replace`).
- `randint(min, max, n = 1)`: returns random integers from a uniform distribution with parameters min and max.
- `normal(mean = 0, sd = 1, n = 1)`: returns random numbers from a normal distribution with parameters min and max.
- `lognormal(meanlog = 0, sdlog = 1, n = 1)`: returns random numbers from a lognormal distribution with parameters min and max.
- `loguniform(minlog = 0, maxlog = 1, n = 1)`: returns random numbers from a loguniform distribution with parameters min and max.
- `beta(shape1, shape2, n = 1)`: returns random numbers from a beta distribution with parameters min and max.

These functions accepts `n` parameter to indicate how many values should be returned.

Usage

```
sits_tuning_hparams(...)
```

Arguments

...	Used to prepare hyper-parameter space

Value

A list containing the hyper-parameter space to be passed to `sits_tuning()`'s `params` parameter.

Examples

```
if (sits_run_examples()) {
    # find best learning rate parameters for TempCNN
    tuned <- sits_tuning(
        samples_modis_ndvi,
        ml_method = sits_tempcnn(),
        params = sits_tuning_hparams(
            optimizer = choice(
                torch::optim_adamw,
                torch::optim_adagrad
            ),
            opt_hparams = list(
                 lr = loguniform(10^-2, 10^-4),
                 weight_decay = loguniform(10^-2, 10^-8)
            )
        ),
        trials = 20,
        multicores = 2,
        progress = FALSE
    )
}
```

---

sits_uncertainty *Estimate classification uncertainty based on probs cube*

Description

Calculate the uncertainty cube based on the probabilities produced by the classifier. Takes a probability cube as input. The uncertainty measure is relevant in the context of active leaning, and helps to increase the quantity and quality of training samples by providing information about the confidence of the model. The supported types of uncertainty are 'entropy', 'least', and 'margin'. 'entropy' is the difference between all predictions expressed as entropy, 'least' is the difference between 1.0 and most confident prediction, and 'margin' is the difference between the two most confident predictions.

Usage

```
sits_uncertainty(cube, ...)

## S3 method for class 'probs_cube'
sits_uncertainty(
  cube,
  ...,
  type = "entropy",
  multicores = 2,
  memsize = 4,
  output_dir,
  version = "v1"
)

## S3 method for class 'probs_vector_cube'
sits_uncertainty(
  cube,
  ...,
  type = "entropy",
  multicores = 2,
  memsize = 4,
  output_dir,
  version = "v1"
)

## Default S3 method:
sits_uncertainty(cube, ...)
```

Arguments

cube	Probability data cube.
...	Other parameters for specific functions.
type	Method to measure uncertainty. See details.
multicores	Number of cores to run the function.
memsize	Maximum overall memory (in GB) to run the function.
output_dir	Output directory for image files.
version	Version of resulting image (in the case of multiple tests).

Value

An uncertainty data cube

Examples

```
if (sits_run_examples()) {
    # create a random forest model
    rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
    # create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # classify a data cube
    probs_cube <- sits_classify(
        data = cube, ml_model = rfor_model, output_dir = tempdir()
    )
    # calculate uncertainty
    uncert_cube <- sits_uncertainty(probs_cube, output_dir = tempdir())
    # plot the resulting uncertainty cube
    plot(uncert_cube)
}
```

---

sits_uncertainty_sampling

Suggest samples for enhancing classification accuracy

Description

Suggest samples for regions of high uncertainty as predicted by the model. The function selects data points that have confused an algorithm. These points don't have labels and need be manually labelled by experts and then used to increase the classification's training set.

This function is best used in the following context: 1. Select an initial set of samples. 2. Train a machine learning model. 3. Build a data cube and classify it using the model. 4. Run a Bayesian smoothing in the resulting probability cube. 5. Create an uncertainty cube. 6. Perform uncertainty sampling.

The Bayesian smoothing procedure will reduce the classification outliers and thus increase the likelihood that the resulting pixels with high uncertainty have meaningful information.

Usage

```
sits_uncertainty_sampling(
  uncert_cube,
  n = 100L,
```

```
  min_uncert = 0.4,
  sampling_window = 10L,
  multicores = 1L,
  memsize = 1L
)
```

Arguments

uncert_cube	An uncertainty cube. See sits_uncertainty.
n	Number of suggested points to be sampled per tile.
min_uncert	Minimum uncertainty value to select a sample.
sampling_window	Window size for collecting points (in pixels). The minimum window size is 10.
multicores	Number of workers for parallel processing (integer, min = 1, max = 2048).
memsize	Maximum overall memory (in GB) to run the function.

Value

A tibble with longitude and latitude in WGS84 with locations which have high uncertainty and meet the minimum distance criteria.

Examples

```
if (sits_run_examples()) {
    # create a data cube
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # build a random forest model
    rfor_model <- sits_train(samples_modis_ndvi, ml_method = sits_rfor())
    # classify the cube
    probs_cube <- sits_classify(
        data = cube, ml_model = rfor_model, output_dir = tempdir()
```

```
    )
    # create an uncertainty cube
    uncert_cube <- sits_uncertainty(probs_cube,
        type = "entropy",
        output_dir = tempdir()
    )
    # obtain a new set of samples for active learning
    # the samples are located in uncertain places
    new_samples <- sits_uncertainty_sampling(
        uncert_cube,
        n = 10, min_uncert = 0.4
    )
}
```

`sits_validate` *Validate time series samples*

Description

One round of cross-validation involves partitioning a sample of data into complementary subsets, performing the analysis on one subset (called the training set), and validating the analysis on the other subset (called the validation set or testing set).

The function takes two arguments: a set of time series with a machine learning model and another set with validation samples. If the validation sample set is not provided, The sample dataset is split into two parts, as defined by the parameter validation_split. The accuracy is determined by the result of the validation test set.

This function returns the confusion matrix, and Kappa values.

Usage

```
sits_validate(
  samples,
  samples_validation = NULL,
  validation_split = 0.2,
  ml_method = sits_rfor(),
  gpu_memory = 4,
  batch_size = 2^gpu_memory
)
```

Arguments

`samples`	Time series to be validated (class "sits").
`samples_validation`	Optional: Time series used for validation (class "sits")
`validation_split`	Percent of original time series set to be used for validation if samples_validation is NULL (numeric value).

ml_method	Machine learning method (function)
gpu_memory	Memory available in GPU in GB (default = 4)
batch_size	Batch size for GPU classification.

Value

A caret::confusionMatrix object to be used for validation assessment.

Note

#' When using a GPU for deep learning, gpu_memory indicates the memory of the graphics card which is available for processing. The parameter batch_size defines the size of the matrix (measured in number of rows) which is sent to the GPU for classification. Users can test different values of batch_size to find out which one best fits their GPU architecture.

It is not possible to have an exact idea of the size of Deep Learning models in GPU memory, as the complexity of the model and factors such as CUDA Context increase the size of the model in memory. Therefore, we recommend that you leave at least 1GB free on the video card to store the Deep Learning model that will be used.

For users of Apple M3 chips or similar with a Neural Engine, be aware that these chips share memory between the GPU and the CPU. Tests indicate that the memsize should be set to half to the total memory and the batch_size parameter should be a small number (we suggest the value of 64). Be aware that increasing these parameters may lead to memory conflicts.

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    samples <- sits_sample(cerrado_2classes, frac = 0.5)
    samples_validation <- sits_sample(cerrado_2classes, frac = 0.5)
    conf_matrix_1 <- sits_validate(
         samples = samples,
         samples_validation = samples_validation,
         ml_method = sits_rfor()
   )
   conf_matrix_2 <- sits_validate(
         samples = cerrado_2classes,
         validation_split = 0.2,
         ml_method = sits_rfor()
   )
}
```

sits_variance *Calculate the variance of a probability cube*

Description

Takes a probability cube and estimate the local variance of the logit of the probability, to support the choice of parameters for Bayesian smoothing.

Usage

```
sits_variance(
  cube,
  window_size = 9L,
  neigh_fraction = 0.5,
  memsize = 4L,
  multicores = 2L,
  output_dir,
  version = "v1"
)

## S3 method for class 'probs_cube'
sits_variance(
  cube,
  window_size = 9L,
  neigh_fraction = 0.5,
  memsize = 4L,
  multicores = 2L,
  output_dir,
  version = "v1"
)

## S3 method for class 'raster_cube'
sits_variance(
  cube,
  window_size = 7L,
  neigh_fraction = 0.5,
  memsize = 4L,
  multicores = 2L,
  output_dir,
  version = "v1"
)

## S3 method for class 'derived_cube'
sits_variance(
  cube,
  window_size = 7L,
  neigh_fraction = 0.5,
```

```
  memsize = 4L,
  multicores = 2L,
  output_dir,
  version = "v1"
)

## Default S3 method:
sits_variance(
  cube,
  window_size = 7L,
  neigh_fraction = 0.5,
  memsize = 4L,
  multicores = 2L,
  output_dir,
  version = "v1"
)
```

Arguments

cube	Probability data cube (class "probs_cube")
window_size	Size of the neighborhood (odd integer)
neigh_fraction	Fraction of neighbors with highest probability for Bayesian inference (numeric from 0.0 to 1.0)
memsize	Maximum overall memory (in GB) to run the smoothing (integer, min = 1, max = 16384)
multicores	Number of cores to run the smoothing function (integer, min = 1, max = 2048)
output_dir	Output directory for image files (character vector of length 1)
version	Version of resulting image (character vector of length 1)

Value

A variance data cube.

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
if (sits_run_examples()) {
    # create a random forest model
    rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
```

```
    # create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # classify a data cube
    probs_cube <- sits_classify(
        data = cube, ml_model = rfor_model, output_dir = tempdir()
    )
    # plot the probability cube
    plot(probs_cube)
    # smooth the probability cube using Bayesian statistics
    var_cube <- sits_variance(probs_cube, output_dir = tempdir())
    # plot the variance cube
    plot(var_cube)
}
```

`sits_view` *View data cubes and samples in leaflet*

Description

Uses leaflet to visualize time series, raster cube and classified images.

To show a false color image, use "band" to chose one of the bands, "tiles" to select tiles, "first_quantile" and "last_quantile" to set the cutoff points. Choose only one date in the "dates" parameter. The color scheme is defined by either "palette" (use an available color scheme) or legend (user-defined color scheme). To see which palettes are pre-defined, use `cols4all::g4a_gui` or select any ColorBrewer name. The "rev" parameter reverts the order of colors in the palette.

To show an RGB composite, select "red", "green" and "blue" bands, "tiles", "dates", "opacity", "first_quantile" and "last_quantile". One can also get an RGB composite, by selecting one band and three dates. In this case, the first date will be shown in red, the second in green and third in blue.

Probability cubes are shown in false color. The parameter "labels" controls which labels are shown. If left blank, only the first map is shown. For color control, use "palette", "legend", and "rev" (as described above).

Vector cubes have both a vector and a raster component. The vector part are the segments produced by `sits_segment`. Their visual output is controlled by "seg_color" and "line_width" parameters. The raster output works in the same way as the false color and RGB views described above.

Classified cubes need information on how to render each class. There are three options: (a) the classes are part of an existing color scheme; (b) the user provides a legend which associates each class to a color; (c) use a generic palette (such as "Spectral") and allocate colors based on this palette. To find out how to create a customized color scheme, read the chapter "Data Visualisation in sits" in the sits book.

To compare different classifications, use the "version" parameter to distinguish between the different maps that are shown.

Vector classified cubes are displayed as classified cubes, with the segments overlaid on top of the class map, controlled by "seg_color" and "line_width".

Samples are shown on the map based on their geographical locations and on the color of their classes assigned in their color scheme. Users can also assign a legend or a palette to choose colors. See information above on the display of classified cubes.

For all types of data cubes, the following parameters apply:

- opacity: controls the transparency of the map.
- max_cog_size: For COG data, controls the level of aggregation to be used for display, measured in pixels, e.g., a value of 512 will select a 512 x 512 aggregated image. Small values are faster to show, at a loss of visual quality.
- leaflet_megabytes: maximum size of leaflet to be shown associated to the map (in megabytes). Bigger values use more memory.
- add: controls whether a new visualisation will be overlaid on top of an existing one. Default is FALSE.

Usage

```
sits_view(x, ...)

## S3 method for class 'sits'
sits_view(x, ..., legend = NULL, palette = "Set3", radius = 5, add = FALSE)

## S3 method for class 'data.frame'
sits_view(x, ..., legend = NULL, palette = "Harmonic", add = FALSE)

## S3 method for class 'som_map'
sits_view(
  x,
  ...,
  id_neurons,
  legend = NULL,
  palette = "Harmonic",
  radius = 5,
  add = FALSE
)

## S3 method for class 'raster_cube'
sits_view(
  x,
  ...,
  band = NULL,
  red = NULL,
  green = NULL,
  blue = NULL,
  tiles = x[["tile"]][[1]],
  dates = NULL,
  palette = "RdYlGn",
```

```
  rev = FALSE,
  opacity = 0.85,
  max_cog_size = 2048,
  first_quantile = 0.02,
  last_quantile = 0.98,
  leaflet_megabytes = 64,
  add = FALSE
)

## S3 method for class 'uncertainty_cube'
sits_view(
  x,
  ...,
  tiles = x[["tile"]][[1]],
  legend = NULL,
  palette = "RdYlGn",
  rev = FALSE,
  opacity = 0.85,
  max_cog_size = 2048,
  first_quantile = 0.02,

  version = NULL,
  legend = NULL,
  palette = "Set3",
  opacity = 0.85,
  add = FALSE
)

## Default S3 method:
sits_view(x, ...)
```

Arguments

x	Object of class "sits", "data.frame", "som_map", "raster_cube", "probs_cube", "vector_cube", or "class cube".
...	Further specifications for sits_view.
legend	Named vector that associates labels to colors.
palette	Color palette from RColorBrewer
radius	Radius of circle markers
add	Add image to current leaflet
id_neurons	Neurons from the SOM map to be shown.
band	Single band for viewing false color images.

red	Band for red color.
green	Band for green color.
blue	Band for blue color.
tiles	Tiles to be plotted (in case of a multi-tile cube).
dates	Dates to be plotted.
rev	Revert color palette?
opacity	Opacity of segment fill or class cube
max_cog_size	Maximum size of COG overviews (lines or columns)
first_quantile	First quantile for stretching images
last_quantile	Last quantile for stretching images
leaflet_megabytes	Maximum size for leaflet (in MB)
version	Version name (to compare different classifications)
label	Label to be plotted (in case of probs cube)
seg_color	Color for segment boundaries
line_width	Line width for segments (in pixels)

Value

A leaflet object containing either samples or data cubes embedded in a global map that can be visualized directly in an RStudio viewer.

}
```

`sits_whittaker` *Filter time series with whittaker filter*

Description

The algorithm searches for an optimal warping polynomial. The degree of smoothing depends on smoothing factor lambda (usually from 0.5 to 10.0). Use lambda = 0.5 for very slight smoothing and lambda = 5.0 for strong smoothing.

Usage

```
sits_whittaker(data = NULL, lambda = 0.5)
```

Arguments

`data`	Time series or matrix.
`lambda`	Smoothing factor to be applied (default 0.5).

Value

Filtered time series

Examples

```
if (sits_run_examples()) {
    # Retrieve a time series with values of NDVI
    point_ndvi <- sits_select(point_mt_6bands, bands = "NDVI")
    # Filter the point using the Whittaker smoother
    point_whit <- sits_filter(point_ndvi, sits_whittaker(lambda = 3.0))
    # Merge time series
    point_ndvi <- sits_merge(point_ndvi, point_whit,
                             suffix = c("", ".WHIT"))
    # Plot the two points to see the smoothing effect
    plot(point_ndvi)
}
```

---

sits_xgboost *Train extreme gradient boosting models*

Description

This function uses the extreme gradient boosting algorithm. Boosting iteratively adds basis functions in a greedy fashion so that each new basis function further reduces the selected loss function. This function is a front-end to the methods in the "xgboost" package. Please refer to the documentation in that package for more details.

Usage

```
sits_xgboost(
  samples = NULL,
  learning_rate = 0.15,
  min_split_loss = 1,
  max_depth = 5,
  min_child_weight = 1,
  max_delta_step = 1,
  subsample = 0.8,
  nfold = 5,
  nrounds = 100,
  nthread = 6,
  early_stopping_rounds = 20,
  verbose = FALSE
)
```

Arguments

samples	Time series with the training samples.
learning_rate	Learning rate: scale the contribution of each tree by a factor of $0 < lr < 1$ when it is added to the current approximation. Used to prevent overfitting. Default: 0.15
min_split_loss	Minimum loss reduction to make a further partition of a leaf. Default: 1.
max_depth	Maximum depth of a tree. Increasing this value makes the model more complex and more likely to overfit. Default: 5.
min_child_weight	If the leaf node has a minimum sum of instance weights lower than min_child_weight, tree splitting stops. The larger min_child_weight is, the more conservative the algorithm is. Default: 1.
max_delta_step	Maximum delta step we allow each leaf output to be. If the value is set to 0, there is no constraint. If it is set to a positive value, it can help making the update step more conservative. Default: 1.
subsample	Percentage of samples supplied to a tree. Default: 0.8.
nfold	Number of the subsamples for the cross-validation.
nrounds	Number of rounds to iterate the cross-validation (default: 100)
nthread	Number of threads (default = 6)
early_stopping_rounds	Training with a validation set will stop if the performance doesn't improve for k rounds.
verbose	Print information on statistics during the process

Value

Model fitted to input data (to be passed to sits_classify)

Note

Please refer to the sits documentation available in <https://e-sensing.github.io/sitsbook/> for detailed examples.

summary.class_cube *Summarize data cubes*

Description

This is a generic function. Parameters depend on the specific type of input.

Usage

```
## S3 method for class 'class_cube'
summary(object, ...)
```

Arguments

object	Object of class "class_cube"
...	Further specifications for summary.

Value

A summary of a classified cube

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # create a random forest model
    rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
    # classify a data cube
    probs_cube <- sits_classify(
        data = cube, ml_model = rfor_model, output_dir = tempdir()
    )
    # label the probability cube
    label_cube <- sits_label_classification(
        probs_cube,
        output_dir = tempdir()
    )
    summary(label_cube)
}
```

---

summary.raster_cube *Summarize data cubes*

Description

This is a generic function. Parameters depend on the specific type of input.

Usage

```
## S3 method for class 'raster_cube'
summary(object, ..., tile = NULL, date = NULL)
```

Arguments

object	Object of classes "raster_cube".
...	Further specifications for summary.
tile	Tile to be summarized
date	Date to be summarized

Value

A summary of the data cube.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Felipe Souza, <felipe.souza@inpe.br>

Examples

```
if (sits_run_examples()) {
    # create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    summary(cube)
}
```

`summary.sits` *Summarize sits*

Description

This is a generic function. Parameters depend on the specific type of input.

Usage

```
## S3 method for class 'sits'
summary(object, ...)
```

Arguments

`object`	Object of class "sits".
`...`	Further specifications for summary.

Value

A summary of the sits tibble.

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Felipe Souza, <felipe.souza@inpe.br>

Examples

```
if (sits_run_examples()) {
    summary(samples_modis_ndvi)
}
```

`summary.sits_accuracy` *Summarize accuracy matrix for training data*

Description

This is a generic function. Parameters depend on the specific type of input.

Usage

```
## S3 method for class 'sits_accuracy'
summary(object, ...)
```

Arguments

`object`	Object of class "sits_accuracy".
`...`	Further specifications for summary.

Value

A summary of the sample accuracy

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    data(cerrado_2classes)
    # split training and test data
    train_data <- sits_sample(cerrado_2classes, frac = 0.5)
    test_data  <- sits_sample(cerrado_2classes, frac = 0.5)
    # train a random forest model
    rfor_model <- sits_train(train_data, sits_rfor())
    # classify test data
    points_class <- sits_classify(
        data = test_data,
        ml_model = rfor_model
    )
    # measure accuracy
    acc <- sits_accuracy(points_class)
    summary(acc)
}
```

summary.sits_area_accuracy *Summarize accuracy matrix for area data*

Description

This is a generic function. Parameters depend on the specific type of input.

Usage

```
## S3 method for class 'sits_area_accuracy'
summary(object, ...)
```

Arguments

object	Object of classe "sits_accuracy".
...	Further specifications for summary.

Value

A summary of the sample accuracy

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # create a random forest model
    rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
    # classify a data cube
    probs_cube <- sits_classify(
        data = cube, ml_model = rfor_model, output_dir = tempdir()
    )
    # label the probability cube
    label_cube <- sits_label_classification(
        probs_cube,
        output_dir = tempdir()
    )
    # obtain the ground truth for accuracy assessment
    ground_truth <- system.file("extdata/samples/samples_sinop_crop.csv",
```

```
        package = "sits"
    )
    # make accuracy assessment
    as <- sits_accuracy(label_cube, validation = ground_truth)
    summary(as)
}
```

---

summary.variance_cube *Summarise variance cubes*

Description

This is a generic function. Parameters depend on the specific type of input.

Usage

```
## S3 method for class 'variance_cube'
summary(
  object,
  ...,
  intervals = 0.05,
  sample_size = 10000,
  quantiles = c("75%", "80%", "85%", "90%", "95%", "100%")
)
```

Arguments

object	Object of class "class_cube"
...	Further specifications for summary.
intervals	Intervals to calculate the quantiles
sample_size	The size of samples will be extracted from the variance cube.
quantiles	Quantiles to be shown

Value

A summary of a variance cube

Author(s)

Gilberto Camara, <gilberto.camara@inpe.br>

Examples

```
if (sits_run_examples()) {
    # create a data cube from local files
    data_dir <- system.file("extdata/raster/mod13q1", package = "sits")
    cube <- sits_cube(
        source = "BDC",
        collection = "MOD13Q1-6.1",
        data_dir = data_dir
    )
    # create a random forest model
    rfor_model <- sits_train(samples_modis_ndvi, sits_rfor())
    # classify a data cube
    probs_cube <- sits_classify(
        data = cube, ml_model = rfor_model, output_dir = tempdir()
    )
    variance_cube <- sits_variance(
        data = probs_cube,
        output_dir = tempdir()
    )
    summary(variance_cube)
}
```

'sits_labels<-' *Change the labels of a set of time series*

Description

Given a sits tibble with a set of labels, renames the labels to the specified in value.

Usage

```
sits_labels(data) <- value

## S3 replacement method for class 'sits'
sits_labels(data) <- value

## S3 replacement method for class 'probs_cube'
sits_labels(data) <- value

## S3 replacement method for class 'class_cube'
sits_labels(data) <- value

## Default S3 replacement method:
sits_labels(data) <- value
```

Arguments

data	Data cube or time series.

value — A character vector used to convert labels. Labels will be renamed to the respective value positioned at the labels order returned by sits_labels.

Value

A sits tibble or data cube with modified labels.

A probs or class_cube cube with modified labels.

Author(s)

Rolf Simoes, <rolf.simoes@inpe.br>

Examples

```
# show original samples ("Cerrado" and "Pasture")
sits_labels(cerrado_2classes)
# rename label samples to "Savanna" and "Grasslands"
sits_labels(cerrado_2classes) <- c("Savanna", "Grasslands")
# see the change
sits_labels(cerrado_2classes)
```
