`barploterrbar` *Barplot with error bars.*

Description

Barplot with error bars.

Usage

```
barploterrbar(y, yl, yh, barcol="orange", errcol="black", horiz=FALSE,
w=0.2, theCut=NULL, columnForDiffBars=TRUE, cex.axis =
par("cex.axis"), zeroForNA=TRUE, legend=FALSE, groups = NULL, order=FALSE, ...)
```

Arguments

<code>y</code>	Numeric vector.
<code>yl</code>	Numeric vector of same length as <code>y</code> .
<code>yh</code>	Numeric vector of same length as <code>y</code> .
<code>barcol</code>	Color of the bars.
<code>errcol</code>	Color of the error bars.
<code>horiz</code>	Logical. As in <code>barplot</code> .
<code>w</code>	Size of the error bar ticks.
<code>theCut</code>	The cut value
<code>columnForDiffBars</code>	Whether the matrix should be transposed (by default the rows are for diff bars)
<code>zeroForNA</code>	Draw 0 instead of NA
<code>cex.axis</code>	Axis font cex
<code>legend</code>	Should a legend be plotted ?
<code>groups</code>	a factor - if specified the bars are colored according to the group they belong to
<code>order</code>	plot sample values in descending order
<code>...</code>	Further arguments that get passed on to <code>barplot</code> .

Details

The function calls `barplot` with `y` and decorates it with error bars according to `yl` and `yh`.

Value

The function is called for its side effect, producing a plot.

Author(s)

Markus Ruschhaupt, Florian Hahne

See Also

[barplot](#)

Examples

```
y <- matrix(runif(80), ncol=5)
ym <- apply(y, 2, mean)
dy <- apply(y, 2, sd)*2/sqrt(nrow(y))
barploterrbar(ym, ym-dy, ym+dy, barcol="#0000c0", errcol="orange")
```

ddCtAbsolute

absolute quantification for Taqman data

Description

absolute quantification for Taqman data

Usage

```
ddCtAbsolute(raw.table, addData, type = "mean", ADD = -30.234, DIV = -1.6268, sa
```

Arguments

raw.table	data frame. It must contain columns with the following names: 'Ct', 'Sample', 'Detector', 'Platename'. The column 'Ct' must contain numeric values.
addData	add data
type	character of length 1. 'mean' or 'median' - which method should be used for the aggregation of the replicates
ADD	Add constant
DIV	Div constant
sampleInformation	if specified it must be an object of class <code>phenoData</code> with a column named 'Sample'.
toZero	boolean - if there is only one replication should the error be treated as zero ? (only if 'type' is mean)
filename	character of length 1. The name of the file the warnings should be stored in.

Value

A an object of class `eSet`. The assayData has the following components: `exprs`, `error`, `Ct`, `Ct.error`, `Difference`, `number_NA`, `number`, `Plate`.

ddCtExpression-class
ddCt Expression

Description

This class is a subclass of `ExpressionSet` and represents objects which are produced by the `ddCt` algorithm in the `ddCtExpression` method

Extends

Class `ExpressionSet`, directly. Class `eSet`, by class "ExpressionSet", distance 2. Class `VersionedBiobase`, by class "ExpressionSet", distance 3. Class `Versioned`, by class "ExpressionSet", distance 4.

Methods

Ct signature(object = "ddCtExpression"): returns the Ct value of this ddCtExpressionobject

CtErr signature(object = "ddCtExpression"): returns the error number of the Ct value of this ddCtExpressionobject

dCt signature(object = "ddCtExpression"): returns the dCt value of this ddCtExpressionobject

dCtErr signature(object = "ddCtExpression"): returns the error number of the dCt value of this ddCtExpressionobject

ddCt signature(object = "ddCtExpression"): returns the ddCt value of this ddCtExpressionobject

ddCtErr signature(object = "ddCtExpression"): returns the error number of the ddCt value of this ddCtExpressionobject

level signature(object = "ddCtExpression"): returns the levels in this ddCtExpressionobject

levelErr signature(object = "ddCtExpression"): returns the error number of the levels in this ddCtExpressionobject

numberCt signature(object = "ddCtExpression"): returns the Ct number of this ddCtExpressionobject

numberNA signature(object = "ddCtExpression"): returns the NA number of this ddCtExpressionobject

elist signature(object = "ddCtExpression"): returns a data frame which represents this expression object

elistWrite signature(object = "ddCtExpression", file = "character"): writes ddCtExpression object into a file

Author(s)

Rudolf Biczok <mailto:r.biczok@dkfz.de>

See Also

[SDMFrame](#): reader for SDM files [elist](#), [elistWrite](#): utility functions for ddCtExpression objects [ddCtExpression](#): the method which invokes the ddCt algorithm

Examples

```
## read a SDM file
sampdat <- SDMFrame(system.file("extdata", "Experiment1.txt",
                                package="ddCt"))

## call ddCtExpression method to get a ddCt calculated expression
result <- ddCtExpression(sampdat,
                          calibrationSample="Sample1",
                          housekeepingGenes=c("Gene1", "Gene2"))

## use getter methods
ddCt(result)
ddCtErr(result)
```

ddCtExpression-methods

Apply the ddCt algorithm for a given data set

Description

Apply the ddCt algorithm for a given data set

Arguments

object	SDMFrame Data object which holds a data set containing columns with the following names: 'Ct', 'Sample', 'Detector', 'Platenname'. The column 'Ct' must contain numeric values.
algorithm	character. Name of the calibration samples.
warningStream	character of length 1. The name of the file the warnings should be stored in.
calibrationSample	character. Name of the calibration samples.
housekeepingGenes	character. Name of the housekeeping genes.
type	character of length 1. 'mean' or 'median'- which method should be used for the aggregation of the replicates
sampleInformation	if specified it must be an object of class phenoData with a column named 'Sample'.
toZero	boolean - if there is only one replication should the error be treated as zero ? (only if 'type' is mean)

```
efficiencies n.V.  
efficiencies.error  
              n.V.
```

Value

A an object of class `ddCtExpression`.

usage

```
ddCtExpression(object, warningStream = "warning.output.txt", algorithm="ddCt" calibrationSample,  
housekeepingGenes, type="mean", sampleInformation=NULL, toZero=TRUE, efficiencies =  
NULL, efficiencies.error = NULL)
```

Methods

object = "InputFrame" An object of `InputFrame`, constructed with the method `InputFrame`

Author(s)

Rudolf Biczok <mailto:r.biczok@dkfz.de>

References

Analysis of relative gene expression data using real-time quantitative PCR and the 2(-Delta -Delta C(T)) Method. KJ Livak and TD Schmittgen, Methods, Vol. 25, No. 4. (December 2001), pp. 402-408

See Also

`InputFrame`: reader for SDM files `ddCtExpression`: representation for ddCt calculated expressions

Examples

```
## read a SDM file  
sampdat <- SDMFrame(system.file("extdata", "Experiment1.txt", package="ddCt"))  
  
## call ddCtExpression method from class SDMFrame  
## to get a ddCt calculated expression  
result <- ddCtExpression(sampdat,  
                        calibrationSample="Sample1",  
                        housekeepingGenes=c("Gene1", "Gene2"))  
  
result
```

elistWrite-methods *Write ddCtExpression object into data frame or files*

Description

ddCtExpression object contains a list of matrices as the results of `ddCt` method. `elist` combines these lists into one data frame, and `elistWrite` writes the data frame into file.

Usage

```
elist(object, ...)
elistWrite(object, file, ...)
```

Arguments

<code>object</code>	an <code>ExpressionSet</code> object.
<code>file</code>	output file.
<code>...</code>	additional arguments passed to <code>write.table</code> .

Details

`elist` is a wrapper to `as(object, "data.frame")` function.

Value

A data frame or output file.

Author(s)

Jitao David Zhang <j.zhang@dkfz.de>

Examples

```
## read a SDM file
sampdat <- SDMFrame(system.file("extdata", "Experiment1.txt", package="ddCt"))

## call ddCtExpression method from class SDMFrame
## to get a ddCt calculated expression
result <- ddCtExpression(sampdat,
                        calibrationSample="Sample1",
                        housekeepingGenes=c("Gene1", "Gene2"))

## call elist
elistResult <- elist(result)
elistResult
```

`errBarchart-methods`*Draw barchart of relative expression level with error-bars*

Description

Draw barchart (with error-bars) of relative expression level represented in `ddCtExpression` object. The barchart is implemented as grid plot by `lattice` package, where each panel represents one sample and the relative expression values of detectors (as well as their standard errors) are depicted as bars.

Detectors which are not determined are marked by grey ND.

Two types of figures are supported: either condition on samples (`by="Sample"`) or on detectors (`by="Detector"`).

Methods

object = "ddCtExpression", by="character" An object of `ddCtExpression`, constructed with the method `ddCtExpression`

`errBarchartParameter-class`*Class "errBarchartParameter"*

Description

Parameter object for `errBarchart`

Objects from the Class

Objects can be created by calls of the form `new("errBarchartParameter", ...)`. So far the object is only internally used, but in the near future it will be exported.

Slots

exprsUndeterminedLabel: Object of class "character", specifying the text label when the expression level is 'Undetermined'

Methods

exprsUndeterminedLabel signature(object = "errBarchartParameter"): getting the text label when the expression level is 'Undetermined'

show signature(object = "errBarchartParameter"): print method

Note

So far it is only internally used

Author(s)

Jitao David Zhang <j.zhang@dkfz.de>

Examples

```
## Internally used
## param <- new("errBarchartParameter")
## exprsUndeterminedLabel (param)
```

getDir

Auxillary functions for the executive scripts

Description

getDir creates a directory in case it does not exist and returns the directory name.

Usage

```
getDir(dir, ...)
```

Arguments

dir	Directory name
...	Other parameters passed to dir.create

Details

Auxillary functions

Value

getDir returns the directory name

Author(s)

Jitao David Zhang <j.zhang@dkfz.de>

Examples

```
getDir(tempdir())
```

InputReader-class *Class "InputReader"*

Description

Abstract factory for data input

Objects from the Class

A virtual Class: No objects may be created from it.

Slots

`files`: Input files

`colmap`: Column mapping

Author(s)

Rudolf Biczok and Jitao David Zhang

Examples

```
showClass("InputReader")
```

```
replaceVectorByEquality
```

```
REPLACE ITEMS OF VECTOR BY EQUALITY
```

Description

The function replces (or updates) the items of a given vector by checking the equality with the `target` parameter. If found, the item will be replaced by the `value` parameter. The length of both `target` and `value` must be the same and could be longer than 1, in which case the replace will be iterated.

Usage

```
replaceVectorByEquality(vector, target, value)
```

Arguments

<code>vector</code>	A vector to be replaced. The items of the vector must be atom types, since the equality is checked by '=='.
<code>target</code>	targets to be replaced, could be either single or a vector
<code>value</code>	values to be replaced at the positions of targets, must be of the same length of <code>target</code>

Details

A warning will be prompted if any item in the `target` cannot be found

Value

A vector of the same length as the parameter `vector`

Author(s)

Jitao David Zhang

See Also

`==` for checking equality.

Examples

```
vector <- c("java", "perl", "python", "c#")
replaceVectorByEquality(vector, target="c#", value="c/c++")
replaceVectorByEquality(vector, target=c("c#", "perl"), value=c("c/c++", "R"))
```

InputFrame-class *Working with SDM files*

Description

The class `InputFrame` provides core functionalities to read gene and sample information from SDM files and calculate them with a `ddCt` algorithm.

The function `InputFrame` reads the data given in the columns 'Detector', 'Sample' and 'Ct' of the specified SDM output files and stores them as a `data.frame`. An additional column including the respective filename is added.

Slots

coreData: Object of class "data.frame": Holds all the required data extracted from the SDM file

files: Object of class "character" contains the source SDM files

Methods

[,][,]\$ signature(x = "InputFrame"): primitive accessors. Returns an object of `InputFrame`-class with the subset data.

names signature(x = "InputFrame"): returns the column names in this SDM object

ddCtExpression signature(object = "InputFrame"): runs a `ddCt` algorithm with this SDM object and returns a object of class `ddCtExpression`

fileNames signature(object="InputFrame"): returns the source SDM file names.

detectorNames signature(object = "InputFrame"): returns the detector names in this SDM object

detectorNames<- signature(object = "InputFrame", value = "character"): replaces the detector names in this SDM object

sampleNames signature(object = "InputFrame"): returns the sample names in this SDM object

sampleNames<- signature(object = "InputFrame", value = "character"): replaces the sample names in this SDM object

uniqueDetectorNames signature(object = "InputFrame"): returns a vector of unique detector names in this SDM object

uniqueDetectorNames<- signature(object = "InputFrame", target = "missing", value = "character"): replaces all detector names given by the 'names' attribute in 'value' with new detector names

uniqueDetectorNames<- signature(object = "InputFrame", target = "character", value = "character"): replaces all detector names given by 'target' with new detector names

uniqueSampleNames<- signature(object = "InputFrame", target = "missing", value = "character"): replaces all sample names given by the 'names' attribute in 'value' with new sample names

uniqueSampleNames<- signature(object = "InputFrame", target = "character", value = "character"): replaces all sample names given by 'target' with new sample names

uniqueSampleNames signature(object = "InputFrame"): returns a vector of unique sample names in this SDM object

removeSample signature(object = "InputFrame", sample="character"): removes the sample(s) specified from the InputFrame object

replaceDetector signature(object = "InputFrame", target="character", value="character"): replace the detectors equal to the target with the value. Both target and value can be vectors of the same length, then the replace takes place iteratively.

replaceSample signature(object = "InputFrame", target="character", value="character"): replace the samples equal to the target with the value. Both target and value can be vectors of the same length, then the replace takes place iteratively.

show signature(object="InputFrame"): pretty print of the InputFrame instance.

rightCensoring signature(object="InputFrame", threshold="numeric"): Right censoring the Ct value, which targets the data points above a certain value (threshold). High Ct values (higher than 40 or 45 by the rule of thumb) are often not accurate and may indicate too weak expression. The function performs the right censoring on the data and set the value above the threshold as NA (by default) or a given value. See the example.

coreData signature(object="InputFrame"): returns the data frame read from SDM file.

coreData<- signature(object="InputFrame"): replace the data frame read from SDM file.

Ct signature(object="InputFrame"): returns the Ct value of the SDM file.

Ct signature(object="InputFrame", value="numeric"): replace the Ct value in the object with the new values, and return the object.

Author(s)

Rudolf Biczok <mailto:r.biczok@dkfz.de>, Jitao David Zhang <mailto:j.zhang@dkfz.de>

[SDMFrame](#) function reads in data from SDM files. Data from SDM files is used to construct [ddCtExpression](#) objects to analyze differential expression.

Examples

```
## read a SDM file
sampdat <- SDMFrame(system.file("extdata", "Experiment1.txt",
                               package="ddCt"))

## you can also write
## sampdat <- new("SDMFrame",system.file("extdata", "Experiment1.txt",
##                                       package="ddCt"))

## use the getter methods
sampleNames(sampdat)
```

```

## or the overloaded primitive accessors
sampdat[1:3,"Sample"]

## see all unique samples
uniqueSampleNames(sampdat)

## replace all sample names 'Sample1' and 'Sample2' in sampdat
## with 'NewSample1' and 'NewSample2'
uniqueSampleNames(sampdat,c("Sample1","Sample2")) <- c("NewSample1","NewSample2")
uniqueSampleNames(sampdat)

## or use this syntax to replace the gene names
uniqueDetectorNames(sampdat) <- c(Gene1="NewGene1", Gene2="NewGene2")
uniqueDetectorNames(sampdat)

## remove sample or detector
removeSample(sampdat, "Sample1")
removeDetector(sampdat, "Gene1")

## replace sample or detector
replaceSample(sampdat, "Sample1", "Sample0")
replaceDetector(sampdat, "Gene1", "PLCG1")

## right censoring the data
rightCensoring(sampdat, 35)
rightCensoring(sampdat, 35, 35)

```

SDMFrame

Read an SDM file

Description

Read an SDM file: Data Output File for SDS, Version 2.1

Usage

```

SDMFrame(file)
readSDM(file)

```

Arguments

file Character vector of filenames

Details

This function reads the data given in the columns 'Detector', 'Sample' and 'Ct' of the specified SDM output file(s) and stores them as a data.frame. An additional column including the respective filename is added.

This function is a wrapper for the SDMFrame constructor

Value

A object of class [SDMFrame](#)

Author(s)

Rudolf Biczok <mailto:r.biczok@dkfz.de>

Examples

```
## read a SDM file
sampdat <- SDMFrame(system.file("extdata", "Experiment1.txt",
                                package="ddCt"))

## you can also write
## sampdat <- new("SDMFrame",system.file("extdata", "Experiment1.txt",
##                                       package="ddCt"))

## or with
## sampdat <- readSDM(system.file("extdata", "Experiment1.txt",
##                               package="ddCt"))

## use the getter methods
sampleNames(sampdat)

## or the overloaded primitive accessors
sampdat[1:3,"Sample"]

## see all unique samples
uniqueSampleNames(sampdat)

## replace all sample names 'Sample1' and 'Sample2' in sampdat
## with 'NewSample1' and 'NewSample2'
uniqueSampleNames(sampdat,c("Sample1","Sample2")) <- c("NewSample1","NewSample2")
uniqueSampleNames(sampdat)

## or use this syntax to replace the gene names
uniqueDetectorNames(sampdat) <- c(Gene1="NewGene1", Gene2="NewGene2")
uniqueDetectorNames(sampdat)
```

write.htmltable *Write a data frame into an html table within a html page*

Description

Write a 'data.frame' into an html table within a html page

Usage

```
write.htmltable(x, filename, title = "", sortby = NULL, decreasing = TRUE, open
```

Arguments

x	'data.frame'
filename	character. File name.
title	character. Title of html page
sortby	character. Name of column by which to sort the table rows
decreasing	logical. Should the sort order be increasing or decreasing?
open	character. This argument is passed onto 'file'

Value

The function is called for its side effect: writing a file

Author(s)

Wolfgang Huber

`writeSimpleTabCsv` *Write a data frame into a tab delimited file*

Description

Write a 'data.frame' into a tab delimited file (not quoted and no-row-name CSV file)

Usage

```
writeSimpleTabCsv(x, file, ...)
```

Arguments

<code>x</code>	'data.frame'
<code>file</code>	character. File name.
<code>...</code>	Additional arguments passed onto the function

Value

The function is called for its side effect: writing a file
