CGHcall

October 25, 2011

CGHcall-package

Calling aberrations for array CGH tumor profiles.

Description

Calls aberrations for array CGH data using a six state mixture model as well as several biological concepts that are ignored by existing algorithms. Visualization of profiles is also provided.

Details

Package: CGHcall
Type: Package
Version: 2.0.0
Date: 2007-03-14
License: GPL

Author(s)

Sjoerd Vosse and Mark van de Wiel

Maintainer: Sjoerd Vosse <s.vosse@vumc.nl>

References

Mark A. van de Wiel, Kyung In Kim, Sjoerd J. Vosse, Wessel N. van Wieringen, Saskia M. Wilting and Bauke Ylstra. CGHcall: calling aberrations for array CGH tumor profiles. *Bioinformatics*, 23, 892-894.

CGHcall

Calling aberrations for array CGH tumor profiles.

Description

Calls aberrations for array CGH data using a six state mixture model.

2 CGHcall

Usage

CGHcall(inputSegmented, prior = "auto", nclass = 4, organism = "human", robustsi

Arguments

inputSegmented

An object of class cghSeg

prior Options are all, not all, or auto. See details for more information.

nclass The number of levels to be used for calling. Either 3 (loss, normal, gain) or 4

(including amplifications).

organism Either human or other. This is only used for chromosome arm information

when prior is set to all or auto (and samplesize > 20).

robustsig Options are yes or no. yes enforces a lower bound on the standard deviation

of the normal segments

nseqfit Maximum number of segments used for fitting the mixture model. Posterior

probabilities are computed for all segments

maxnumseg Maximum number of segments per profile used for fitting the model

minlsforfit Minimum length of the segment (in Mb) to be used for fitting the model

Details

Please read the article and the supplementary information for detailed information on the algorithm. The parameter prior states how the data is used to determine the prior probabilities. When set to all, the probabilities are determined using the entire genome of each sample. When set to not all probabilites are determined per chromosome for each sample when organism is set to other or per chromosome arm when organism is human. The chromosome arm information is taken from the March 2006 version of the UCSC database. When prior is set to auto, the way probabilities are determined depends on the sample size. The entire genome is used when the sample size is smaller than 20, otherwise chromosome (arm) information is used. Please note that CGHcall uses information from all input data to determine the aberration probabilities. When for example triploid or tetraploid tumors are observed, we advise to run CGHcall separately on those (groups of) samples. Note that robustsig = yes enforces the sd corresponding to the normal segments to be at least half times the pooled gain/loss sd. Use of "nsegfit" significantly lower computing time with respect to previous CGHcall versions without much accuracy loss. Moreover, "maxnumseg" decreases the impact on the results of profiles with inferior segmentation results. Finally, "minlsforfit" decreases the impact of very small aberations (potentially CNVs rather than CNAs) on the fit of the model. Note that always a result for all segments is produced. IN MOST CASES, CGHcall SHOULD BE FOLLOWED BY FUNCTION ExpandCGHcall.

Value

This function return a list with five components:

posteriorfin2

Matrix containing call probabilities for each segment. First column denotes profile number, followed by k columns with aberration probabilities for each

sample, where k is the number of levels used for calling (nclass).

nclone Number of clone or probes

nc Number of samples

Number of classes used

ExpandCGHcall 3

regionsprof Matrix containing information about the segments, 4 colums: profile, start probe, end probe, segmented value

ExpandCGHcall

Examples

```
data(Wilting)
## Convert to \code{\link{cghRaw}} object
cgh <- make_cghRaw(Wilting)</pre>
print (cgh)
## First preprocess the data
raw.data <- preprocess(cgh)</pre>
## Simple global median normalization for samples with 75% tumor cells
perc.tumor \leftarrow rep(0.75, 3)
normalized.data <- normalize(raw.data, cellularity=perc.tumor)</pre>
## Segmentation with slightly relaxed significance level to accept change-points.
## Note that segmentation can take a long time.
## Not run: segmented.data <- segmentData(normalized.data, alpha=0.02)
## Not run: postsegnormalized.data <- postsegnormalize(segmented.data)
## Call aberrations
## Not run: result <- CGHcall(postsegnormalized.data)
## Expand to CGHcall object
## Not run: result <- ExpandCGHcall(result,postsegnormalized.data)
```

ExpandCGHcall

Expands result fron CGHcall to CGHcall object.

Description

Expands result from CGHcall function to CGHcall object.

Usage

```
ExpandCGHcall(listcall,inputSegmented, digits=3, divide=4, memeff = FALSE, filed
```

4 ExpandCGHcall

Arguments

listcall	List object; output of function CGHcall	
inputSegmented		
	An object of class cghSeg	
digits	Number of decimal digits to be saved in the resulting call object. Allows for saving storage space	
divide	Number of batches to divide the work load in. Larger values saves memory, but requires more computing time	
memeff	When set to TRUE, memory efficient mode is used: results are written in batches to multiple external files. If FALSE, one output object is provided.	
fileoutpre	Only relevant when memeff=TRUE. Define prefix for output file names	

Details

This function is new in version 2.7.0. It allows more memory efficient handling of large data objects. If R crashes because of memory problem, we advise to set memeff = TRUE and increase the value of divide. When multiple files are output (in case of memeff=TRUE) the function combine may be used to combine CGHcall objects.

Value

An object of class cghCall-class either as one object (when memeff = FALSE) or as multiple objects stored in .Rdata files in the working directory (when memeff = FALSE)

Wilting

Cervical cancer arrayCGH data

Description

A dataframe containing 4709 rows and 8 columns with arrayCGH data.

Usage

Wilting

Format

A dataframe containing the following 8 columns:

Name The unique identifiers of array elements.

Chromosome Chromosome number of each array element.

Position Chromosomal position in bp of each array element.

AdCA10 Raw log2 ratios for cervical cancer sample AdCA10.

SCC27 Raw log2 ratios for cervical cancer sample SCC27.

SCC32 Raw log2 ratios for cervical cancer sample SCC32.

SCC36 Raw log2 ratios for cervical cancer sample SCC36.

SCC39 Raw log2 ratios for cervical cancer sample SCC39.

Source

Increased gene copy numbers at chromosome 20q are frequent in both squamous cell carcinomas and adenocarcinomas of the cervix. *Journal of Pathology*, 210, 258-259.

chromosomes

Retrieve feature position data from cgh objects.

Description

These generic functions access the position data stored in the featureData of an object derived from the cghRaw-class, cghSeg-class or cghCall-class.

Usage

```
chromosomes(object)
bpstart(object)
bpend(object)
```

6 cghCall

Arguments

object

Object derived from class cghRaw, cghSeg, or cghCall

Value

chromosomes returns a vector of chromosome numbers; bpstart returns a vector of basepair start positions; bpend returns a vector of basepair end positions;

```

cghCall

Class to contain and describe called array comparative genomic

Description

Container for aCGH data and experimental metadata. cghCall class is derived from eSet, and requires the following matrices of equal dimension as assayData members:

- copynumber
- segmented
- calls
- probloss
- probnorm
- probgain

Furthermore, columns named Chromosome, Start, and End are required as featureData members, containing feature position information.

Extends

Directly extends class eSet.

Creating Objects

```
new('cghCall', phenoData = [AnnotatedDataFrame], experimentData = [MIAME],
annotation = [character], copynumber = [matrix], segmented = [matrix],
calls = [matrix], probloss = [matrix], probnorm = [matrix], probgain
= [matrix], featureData = [AnnotatedDataFrame], ...)
```

An object of class cghCall is generally obtained as output from CGHcall.

cghCall 7

Slots

Inherited from eSet:

assayData: Contains matrices with equal dimensions, and with column number equal to nrow (phenoData). assayData must contain the following matrices

- copynumber
- segmented
- calls
- probloss
- probnorm
- probgain

with rows representing array probes and columns representing samples. Additional matrices of identical size (e.g., representing measurement errors) may also be included in assayData. Class:AssayData-class

phenoData: See eSet

featureData: An AnnotatedDataFrame with columns Chromosome, Start, and End containing array element position data.

experimentData: See eSet
annotation: See eSet

Methods

Class-specific methods.

copynumber(cghCall), copynumber(cghCall, matrix) <- Access and set elements named copynumber in the AssayData-class slot.

segmented(cghCall), segmented(cghCall, matrix) <- Access and set elements named
segmented in the AssayData-class slot.</pre>

calls(cghCall), calls(cghCall, matrix) <- Access and set elements named calls
 in the AssayData-class slot.</pre>

probloss (cghCall), probloss (cghCall, matrix) <- Access and set elements named
 probloss in the AssayData-class slot.</pre>

probnorm(cghCall),probnorm(cghCall,matrix) <- Access and set elements named
probnorm in the AssayData-class slot.</pre>

probgain(cghCall), probgain(cghCall, matrix) <- Access and set elements named
 probgain in the AssayData-class slot.</pre>

chromosomes, bpstart, bpend Access the chromosomal positions stored in featureData

plot Create a plot containing log2ratios, segments and call probabilities ordered by chromosomal position. TWO EXTRA OPTIONS PLUS DEFAULTS: dotres=10. Every dotres-th log2-ratio is plotted. dotres=1 plots all data. However, higher values save a lot of space and allow quicker browsing of the plots. ylimit=c(-5,5): limits of the y-axis

plot.summary Create a plot summarizing the call probabilities of all samples

See eSet for derived methods.

   log2ratios <- copynumber(called[,3:4])</pre>
   # get the names of the samples
   sampleNames (called)
   # get the names of the array elements
   featureNames (called)
## End(Not run)
```

cghRaw

Class to contain and describe raw or normalized array comparative

Description

Container for aCGH data and experimental metadata. cghRaw class is derived from eSet, and requires a matrix named copynumber as assayData member. Furthermore, columns named Chromosome, Start, and End are required as featureData members, containing feature position information.

Extends

Directly extends class eSet.

Creating Objects

```
new('cghRaw', phenoData = [AnnotatedDataFrame], experimentData = [MIAME],
annotation = [character], copynumber = [matrix], featureData = [AnnotatedDataFra...)
```

make_cghRaw is a function to convert a dataframe or textfile to an object of class cghRaw. The input should be either a dataframe or a tabseparated textfile (textfiles must contain a header). The

cghRaw 9

first three columns should contain the name, chromosome and position in bp for each array target respectively. The chromosome and position column must contain numbers only. Following these is a column with log2 ratios for each of your samples. If the input type is a textfile, missing values should be represented as 'NA' or an empty field.

Slots

Inherited from eSet:

```
assayData: Contains matrices with equal dimensions, and with column number equal to nrow (phenoData).

assayData must contain a matrix copynumber with rows represening array probes and columns representing samples. Additional matrices of identical size (e.g., representing measurement errors) may also be included in assayData. Class:AssayData-class

phenoData: See eSet

featureData: An AnnotatedDataFrame with columns Chromosome, Start, and End containing array element position data.

experimentData: See eSet

annotation: See eSet
```

Methods

Class-specific methods.

```
copynumber(cghRaw), copynumber(cghRaw, matrix) <- Access and set elements named
  copynumber in the AssayData-class slot.
```

chromosomes, bpstart, bpend Access the chromosomal positions stored in featureData plot Create a plot containing log2ratios ordered by chromosomal position

See eSet for derived methods. Annotation functionality is not yet supported.

```
# create an instance of cghRaw
new("cghRaw")

# create an instance of cghRaw from a dataframe
data(Wilting)
rawcgh <- make_cghRaw(Wilting)

# plot the first sample
plot(rawcgh[,1])
# first three chromosomes
plot(rawcgh[chromosomes(rawcgh)==1,1])

# get the copynumber values of the third and fourth sample
log2ratios <- copynumber(rawcgh[,3:4])</pre>
```

10 cghSeg

```
# get the names of the samples
sampleNames(rawcgh)
# get the names of the array elements
featureNames(rawcgh)
```

cghSeg

Class to contain and describe segmented array comparative genomic

Description

Container for aCGH data and experimental metadata. cghSeg class is derived from eSet, and requires a matrix named copynumber as well as a matrix named segmented as assayData members of equal dimensions. Furthermore, columns named Chromosome, Start, and End are required as featureData members, containing feature position information.

Extends

Directly extends class eSet.

Creating Objects

```
new('cghSeg', phenoData = [AnnotatedDataFrame], experimentData = [MIAME],
annotation = [character], copynumber = [matrix], segmented = [matrix],
featureData = [AnnotatedDataFrame], ...)
```

An object of class cghSeg is generally obtained as output from segmentData.

Slots

Inherited from eSet.:

```
assayData: Contains matrices with equal dimensions, and with column number equal to nrow (phenoData).

assayData must contain matrices copynumber and segmented with rows represening array probes and columns representing samples. Additional matrices of identical size (e.g., representing measurement errors) may also be included in assayData. Class:AssayData-class

   # get the names of the samples
   sampleNames(segmented)
   # get the names of the array elements
   featureNames (segmented)
## End(Not run)
```

copynumber

Retrieve copynumber data from cgh objects.

Description

These generic functions access the copynumber values of assay data stored in an object derived from the cghRaw-class, cghSeg-class or cghCall-class.

12 make_cghRaw

Usage

```
copynumber(object)
copynumber(object) <- value
segmented(object)
segmented(object) <- value
calls(object)
calls(object) <- value</pre>
```

Arguments

object Object derived from class cghRaw, cghSeg, or cghCall value Matrix with rows representing features and columns samples.

Value

copynumber returns a matrix of copynumber values;

Author(s)

Sjoerd Vosse

See Also

```
cghRaw-class, cghSeg-class, cghCall-class
```

make_cghRaw

Convert a dataframe or textfile to an object of class cghRaw.

Description

This function converts a dataframe of appropriote format to an object of class cghRaw.

Usage

```
make_cghRaw(input)
```

Arguments

input

Either a dataframe or character string containing a filename. See details for the format.

Details

The input should be either a dataframe or a tabseparated textfile (textfiles must contain a header). The first four columns should contain the name, chromosome and the start and end position in bp for each array target respectively. The chromosome and position column must contain numbers only. Following these is a column with log2 ratios for each of your samples. If the input type is a textfile, missing values should be represented as 'NA' or an empty field.

Value

This function returns an object of class cghRaw-class.

normalize 13

Author(s)

Sjoerd Vosse & Mark van de Wiel

Examples

```
data(Wilting)
## Convert to \code{\link{cghRaw}} object
cqh <- make_cghRaw(Wilting)
```

normalize

Normalization and cellularity adjustment for arrayCGH data.

Description

This function normalizes arrayCGH data using the global mode or median. It can also adjust for the cellularity of your data.

Usage

```
normalize(input, method = "median", cellularity = 1, smoothOutliers = TRUE, ...)
```

Arguments

input Object of class cghRaw. Normalization method, either 'median', 'mode', or 'none'. method A vector of cellularities ranging from 0 to 1 to define the contamination of your cellularity sample with healthy cells (1 = no contamination). See details for more information. smoothOutliers Logical. Indicates whether outliers should be smoothed using the smooth. CNA

function.

Arguments for smooth.CNA.

Details

The cellularity parameter should be a vector of length n where n is the number of samples in your dataset. The vector is recycled if there are not enough values in it, or truncated if there are too many. For more information on the correction we refer to section 1.6 of the supplementary information for van de Wiel et al. 2006.

Value

This function returns a dataframe in the same format as the input with normalized and/or cellularity adjusted log2 ratios.

Author(s)

Sjoerd Vosse & Mark van de Wiel

14 plot.summary

Examples

```
data(WiltingData)
## Convert to 'cghRaw' object
cgh <- cghRaw(WiltingData)
## First preprocess the data
raw.data <- preprocess(cgh)
## Simple global median normalization for samples with 75% tumor cells
perc.tumor <- rep(0.75, 3)
normalized.data <- normalize(raw.data, cellularity=perc.tumor)</pre>
```

plot.summary

Visualization of aCGH profiles.

Description

This function creates a summary plot for aCGH profiles.

Usage

```
plot.summary(x, y, ...)
```

Arguments

x An object of class cghCall.

Y This argument is not used and should be missing.

... Arguments plot.

Details

We find plotted on the x-axis the array probes sorted by chromosomal position. The vertical bars represent the average probability that the positions they cover are gained (green bars) or lost (red bars). The green bars represent gains, the red bars represent losses. When 4 levels have been used for calling, amplifications are indicated with a blue tickmark at the top of the plot.

Value

This function creates a plot.

Author(s)

Sjoerd Vosse & Mark van de Wiel

References

Mark A. van de Wiel, Kyung In Kim, Sjoerd J. Vosse, Wessel N. van Wieringen, Saskia M. Wilting and Bauke Ylstra. CGHcall: calling aberrations for array CGH tumor profiles. *Bioinformatics*, 23, 892-894.

postsegnormalize 15

Examples

```
## Not run:
   data(Wilting)
   rawcgh <- make_cghSeg(Wilting)
   normalized <- normalize(rawcgh)
   segmented <- segmentData(normalized)
   called <- CGHcall(segmented)
   plot.summary(called)

## End(Not run)</pre>
```

postsegnormalize

Post-segmentation normalization

Description

This function normalizes arrayCGH data after segmentation in order to find a better 0-level.

Usage

```
postsegnormalize(segmentData, inter=c(-0.1,0.1))
```

Arguments

```
segmentData Object of class cghSeg.

inter Interval in which the function should search for the normal level.
```

Details

This function recursively searches for the interval containing the most segmented data, decreasing the interval length in each recursion. The recursive search makes the post-segmentation normalization robust against local maxima. This function is particularly useful for profiles for which, after segmentation, the 0-level does not coincide with many segments. It is more or less harmless to other profiles. We advise to keep the search interval (inter) small, in particular at the positive (gain) side to avoid that the 0-level is set to a common gain level.

Value

This function returns a cghSeg object in the same format as the input with post-segmentation-normalized adjusted log2 ratios and segmented values.

Author(s)

Mark van de Wiel

16 preprocess

Examples

```
data(Wilting)
## Convert to \code{\link{cghRaw}} object
cgh <- make_cghRaw(Wilting)
## First preprocess the data
raw.data <- preprocess(cgh)
## Simple global median normalization for samples with 75% tumor cells
perc.tumor <- rep(0.75, 3)
normalized.data <- normalize(raw.data, cellularity=perc.tumor)
## Segmentation with slightly relaxed significance level to accept change-points.
## Note that segmentation can take a long time.
## Not run: segmented.data <- segmentData(normalized.data, alpha=0.02)
## Not run: postsegnormalized.data <- postsegnormalize(segmented.data, inter=c(-0.1,0.1)</pre>
```

preprocess

Preprocess arrayCGH data

Description

This function preprocesses your aCGH data so it can be processed by other functions without errors.

Usage

```
preprocess(input, maxmiss = 30, nchrom = 23, ...)
```

Arguments

```
    input Object of class cghRaw.
    maxmiss Maximum percentage of missing values per row.
    nchrom Number of chromosomes.
    ... Arguments for impute.knn from the impute package.
```

Details

This function performs the following actions on arrayCGH data:

- Filter out data with missing position information.
- Remove data on chromosomes larger than nchrom.
- Remove rows with more than maxmiss percentage missing values.
- Imputes missing values using the impute.knn function from the impute package.

Value

This function returns a dataframe in the same format as the input with missing values imputed.

probloss 17

References

Olga Troyanskaya, Michael Cantor, Gavin Sherlock, Pat Brown, Trevor Hastie, Robert Tibshirani, David Botstein, and Russ B. Altman (2001). Missing value estimation methods for DNA microarrays. *Bioinformatics*, 17, 520-525.

Examples

```
data(WiltingRaw)
preprocessed <- preprocess(WiltingRaw, nchrom = 22)</pre>
```

probloss

Retrieve call probabilities from a cghCall object.

Description

These generic functions access the call probabilities from assay data stored in a object derived from the cghCall-class.

Usage

```
probloss(object)
probloss(object) <- value
probnorm(object)
probnorm(object) <- value
probgain(object)
probgain(object) <- value
probamp(object)
probamp(object) <- value</pre>
```

Arguments

object derived from class cghCall

value Matrix with rows representing features and columns samples.

Value

probloss returns matrix of call probabilities;

18 segmentData

segmentData

Breakpoint detection for arrayCGH data.

Description

A wrapper function to run existing breakpoint detection algorithms on arrayCGH data. Currently only DNAcopy is implemented.

Usage

```
segmentData(input, method = "DNAcopy", ...)
```

Arguments

input Object of class cghRaw.

method The method to be used for breakpoint detection. Currently only 'DNAcopy' is

supported, which will run the segment function.

... Arguments for segment.

Details

See segment for details on the algorithm.

Value

This function returns a dataframe in the same format as the input with segmented arrayCGH data.
