# Package 'topGO' 

April 15, 2020

## Type Package

Title Enrichment Analysis for Gene Ontology
Version 2.38.1
Date 2016-02-03
Author Adrian Alexa, Jorg Rahnenfuhrer
Maintainer Adrian Alexa [adrian.alexa@gmail.com](mailto:adrian.alexa@gmail.com)
Description topGO package provides tools for testing GO terms while accounting for the topology of the GO graph. Different test statistics and different methods for eliminating local similarities and dependencies between GO terms can be implemented and applied.

```

```
annFUN Functions which map gene identifiers to GO terms
```

## Description

These functions are used to compile a list of GO terms such that each element in the list is a character vector containing all the gene identifiers that are mapped to the respective GO term.

## Usage

```
annFUN.db(whichOnto, feasibleGenes = NULL, affyLib)
annFUN.org(whichOnto, feasibleGenes = NULL, mapping, ID = "entrez")
annFUN(whichOnto, feasibleGenes = NULL, affyLib)
annFUN.gene2GO(whichOnto, feasibleGenes = NULL, gene2GO)
annFUN.GO2genes(whichOnto, feasibleGenes = NULL, GO2genes)
annFUN.file(whichOnto, feasibleGenes = NULL, file, ...)
readMappings(file, sep = "\t", IDsep = ",")
inverseList(l)
```

## Arguments

| whichOnto | character string specifying one of the three GO ontologies, namely: "BP", "MF", <br> "CC" <br> character vector containing a subset of gene identifiers. Only these genes will <br> be used to annotate GO terms. Default value is NULL which means that there are <br> no genes filtered. <br> character string containing the name of the Bioconductor annotaion package for <br> a specific microarray chip. <br> named list of character vectors. The list names are genes identifiers. For each <br> gene the character vector contains the GO identifiers it maps to. Only the most <br> specific annotations are required. |
| :--- | :--- |
| affyLib | named list of character vectors. The list names are GO identifiers. For each GO <br> the character vector contains the genes identifiers which are mapped to it. Only <br> the most specific annotations are required. |
| GO2genes | character string specifieng the name of the Bioconductor package containing the <br> gene mappings for a specific organism. For example: mapping = "org. Hs.eg. db". <br> character string specifing the gene identifier to use. Currently only the following <br> identifiers can be used: c ("entrez", "genbank", "alias", "ensembl", "symbol", "genename", "u <br> mapping |
| ID | character string specifing the file containing the annotations. <br> other parameters <br> the character used to separate the columns in the CSV file |
| file | the character used to separate the annotated entities |
| a list containing mappings |  |

## Details

All these function restrict the GO terms to the ones belonging to the specified ontology and to the genes listed in the feasibleGenes attribute (if not empty).
The function annFUN. db uses the mappings provided in the Bioconductor annotation data packages. For example, if the Affymetrix hgu133a chip it is used, then the user should set affyLib = "hgu133a.db".
The functions annFUN.gene2GO and annFUN.GO2genes are used when the user provide his own annotations either as a gene-to-GOs mapping, either as a GO-to-genes mapping.

The annFUN. org function is using the mappings from the "org.XX.XX" annotation packages. The function supports different gene identifiers.
The annFUN. file function will read the annotationsof the type gene2GO or GO2genes from a text file.

## Value

A named(GO identifiers) list of character vectors.

classicCount-class Class "classicCount"

## Description

This class that extends the virtual class "groupStats" by adding a slot representing the significant members.

## Details

This class is used for test statistic based on counts, like Fisher's exact test

## Objects from the Class

Objects can be created by calls of the form new("classicCount", testStatistic = "function", name = "character", allMembers = "character", groupMembers = "character", sigMembers = "character").

## Slots

significant: Object of class "integer" ~~
name: Object of class "character" ~~
allMembers: Object of class "character" ~~
members: Object of class "character" ~~
testStatistic: Object of class "function" ~~

## Extends

Class "groupStats", directly.

## Methods

```
contTable signature(object = "classicCount"): ...
initialize signature(.Object = "classicCount"): ..
numSigAll signature(object = "classicCount"): ...
numSigMembers signature(object = "classicCount"): ..
sigAllMembers signature(object = "classicCount"):
sigMembers<- signature(object = "classicCount"): ..
sigMembers signature(object = "classicCount"): ..
```

## Author(s)

Adrian Alexa

## See Also

classicScore-class, groupStats-class, getSigGroups-methods

## Examples

\#\#---- Should be DIRECTLY executable !! ----

```
classicExpr-class Class "classicExpr"
```

## Description

This class that extends the virtual class "groupStats" by adding two slots for accomodating gene expression data.

## Objects from the Class

Objects can be created by calls of the form new("classicExpr", testStatistic, name, groupMembers, exprDat, pTyp

## Slots

eData: Object of class "environment" ~~
pType: Object of class "factor" ~~
name: Object of class "character" ~~
allMembers: Object of class "character" ~~
members: Object of class "character" ~~
testStatistic: Object of class "function" ~~
testStatPar: Object of class "list" ~~

## Extends

Class "groupStats", directly.

## Methods

allMembers<- signature(object = "classicExpr"): ...
emptyExpr signature(object = "classicExpr"):
getSigGroups signature(object = "topGOdata", test.stat = "classicExpr"): ...
GOglobalTest signature (object = "classicExpr"): ...
initialize signature(.Object = "classicExpr"): ...
membersExpr signature (object = "classicExpr"):
pType<- signature(object = "classicExpr"): ...
pType signature(object = "classicExpr"): ...

## Author(s)

Adrian Alexa

## See Also

classicScore-class, groupStats-class, getSigGroups-methods

## Examples

showClass("classicExpr")

```
classicScore-class Class "classicScore"
```

## Description

A class that extends the virtual class "groupStats" by adding a slot representing the score of each gene. It is used for tests like Kolmogorov-Smirnov test.

## Objects from the Class

Objects can be created by calls of the form new("classicScore", testStatistic, name, allMembers, groupMembers

## Slots

score: Object of class "numeric" ~~
name: Object of class "character" ~~
allMembers: Object of class "character" ~~
members: Object of class "character" ~~
testStatistic: Object of class "function" ~~
scoreOrder: Object of class "character" ~~
testStatPar: Object of class "ANY" ~~

## Extends

Class "groupStats", directly.

## Methods

allScore Method to obtain the score of all members.
scoreOrder Returns TRUE if the score should be ordered increasing, FALSE otherwise.
membersScore signature(object = "classicScore"): ...
rankMembers signature(object = "classicScore"): ...
score<- signature(object = "classicScore"): ..

## Author(s)

Adrian Alexa

## Examples

```
## define the type of test you want to use
test.stat <- new("classicScore", testStatistic = GOKSTest, name = "KS tests")
```

Determines the levels of a Directed Acyclic Graph (DAG)
Utility functions to work with Directed Acyclic Graphs (DAG)

## Description

Basic functions to work witg DAGs

## Usage

buildLevels(dag, root $=$ NULL, leafs2root $=$ TRUE)
getNoOfLevels(graphLevels)
getGraphRoot(dag, leafs2root = TRUE)
reverseArch(dirGraph, useAlgo = "sparse", useWeights = TRUE)

## Arguments

dag A graphNEL object.
root A character vector specifing the root(s) of the DAG. If not specified the root node is autmatically computed.
leafs2root The leafs2root parameter tell if the graph has edges directed from the leaves to the root, or vice-versa
graphLevels An object of type list, returned by the buildLevels function.
dirGraph A graphNEL object containing a directed graph.

| useAlgo | A character string specifing one of the following options c("sparse", "normal"). <br> By default, useAlgo = "sparse", a sparce matrix object is used to transpose the <br> adjacency matrix. Otherwise a standard R martix is used. |
| :--- | :--- |
| useWeights | If weights should be used (if useAlgo = "normal" then the weigths are used <br> anyway) |

## Details

buildLevels function determines the levels of a Directed Acyclic Graph (DAG). The level of a node is defined as the longest path from the node to the root. The function take constructs a named list containg varios information about each nodes level. The root has level 1.
getNoOfLevels - a convenient function to extract the number of levels from the object returned by buildLevels
getGraphRoot finds the root(s) of the DAG
reverseArch - simple function to invert the direction of edges in a DAG. The returned graph is of class graphNEL. It can use either simple matrices or sparse matrices (SparseM library)

## Value

buildLevels returns a list containing:
level2nodes Environment where the key is the level number with the value being the nodes on that level.
nodes2level Environment where the key is the node label (the GO ID) and the value is the level on which that node lies.
noOfLevels The number of levels
noOfNodes The number of nodes

An object of class graphNEL-class is returned.

## Author(s)

Adrian Alexa

## Examples

```
##---- Should be DIRECTLY executable !! ----
##-- ==> Define data, use random,
##--or do help(data=index) for the standard data sets.
```

dignostic-methods Diagnostic functions for topGOdata and topGOresult objects.

## Description

The GenTable function generates a summary of the results of the enrichment analysis.
The showGroupDensity function plots the distributions of the gene' scores/ranks inside a GO term. The printGenes function shows a short summary of the top genes annotated to the specified GO terms.

## Usage

GenTable(object, ...)
showGroupDensity(object, whichGO, ranks = FALSE, rm.one = TRUE)
printGenes(object, whichTerms, file, ...)

## Arguments

object an object of class topGOdata.
whichGO the GO terms for which the plot should be generated.
ranks if ranks should be used instead of scores.
rm.one the p-values which are 1 are removed.
whichTerms
character vector listing the GO terms for which the summary should be printed.
file character string specifying the file in which the results should be printed.
... Extra arguments for GenTable can be:
... one or more objects of class topGOresult.
orderBy if more than one topGOresult object is given then orderBy gives the index of which scores will be used to order the resulting table. Can be an integer index or a character vector given the name of the topGOresult object.
ranksOf same as orderBy argument except that this parameter shows the relative ranks of the specified result.
topNodes the number of top GO terms to be included in the table.
numChar the GO term definition will be truncated such that only the first numChar characters are shown.
Extra arguments for printGenes can be:
chip character string containing the name of the Bioconductor annotation package for a microarray chip.
numChar the gene description is trimmed such that it has numChar characters.
simplify logical variable affecting how the results are returned.
geneCutOff the maximal number of genes shown for each term.
pvalCutOff only the genes with a p-value less than pvalCutOff are shown.
oneFile if TRUE then a file for each GO term is generated.

## Details

GenTable is an easy to use function for summarising the most significant GO terms and the corresponding p-values. The function dispatches for topGOdata and topGOresult objects, and it can take an arbitrary number of the later, making comparison between various results easier.
Note: One needs to type the complete attribute names (the exact name) of this function, like: topNodes $=5$, rankOf $=$ "resultFis", etc. This being the price paid for flexibility of specifying different number of topGOdata objects.
The showGroupDensity function analyse the distribution of the gene-wise scores for a specified GO term. The function will show the distribution of the genes in a GO term compared with the complementary set, using a lattice plot.
printGenes The function will generate a table with all the probes annotated to the specified GO term. Various type of identifiers, the gene name and the gene-wise statistics are provided in the table.

One or more GO identifiers can be given to the function using the whichTerms argument. When more than one GO is specified, the function returns a list of data.frames, otherwise only one data. frame is returned.

The function has a argument file which, when specified, will save the results into a file using the CSV format.

For the moment the function will work only when the chip used has an annotation package available in Bioconductor. It will not work with other type of custom annotations.

## Value

A data.frame or a list of data.fames.

Gene set tests statistics

## Description

Methods which implement and run a group test statistic for a class inheriting from groupStats class. See Details section for a description of each method.

## Usage

GOFisherTest(object)
GOKSTest (object)
GOtTest (object)
GOglobalTest(object)
GOSumTest (object)
GOKSTiesTest(object)

## Arguments

object An object of class groupStats or decedent class.

## Details

GOFisherTest: implements Fischer's exact test (based on contingency table) for groupStats objects dealing with "counts".
GOKSTest: implements the Kolmogorov-Smirnov test for groupStats objects dealing with gene "scores". This test uses the ks. test function and does not implement the running-sum-statistic test based on permutations.
GOtTest: implements the $t$-test for groupStats objects dealing with gene "scores". It should be used when the gene scores are $t$-statistics or any other score following a normal distribution.
GOglobalTest: implement Goeman's globaltest.

## Value

All these methods return the p-value computed by the respective test statistic.

## Author(s)

Adrian Alexa

## See Also

```
groupStats-class, getSigGroups-methods
```

```
geneList A toy example of a list of gene identifiers and the respective p-values
```

## Description

The geneList data is compiled from a differential expression analysis of the ALL dataset. It contains just a small number of genes with the corespondent p -values. The information on where to find the GO annotations is stored in the ALL object.

The topDiffGenes function included in this dataset will select the differentially expressed genes, at 0.01 significance level, from geneList.

## Usage

data(geneList)

## Source

Generated using the ALL gene expression data. See the "scripts" directory.

## Examples

```
data(geneList)
## print the object
head(geneList)
length(geneList)
## the number of genes with a p-value less than 0.01
sum(topDiffGenes(geneList))
```

getPvalues Convenient function to compute $p$-values from a gene expression matrix.

## Description

Warping function of "mt.teststat", for computing p -values of a gene expression matrix.

## Usage

getPvalues(edata, classlabel, test = "t", alternative = c("greater", "two.sided", "less")[1], genesID = NULL, correction = c("none", "Bonferroni", "Holm", "Hochberg", "SidakSS", "SidakSD", "BH", "BY")[8])

## Arguments

| edata | Gene expression matrix. |
| :--- | :--- |
| classlabel | The phenotype of the data |
| test | Which test statistic to use |
| alternative | The alternative of the test statistic |
| genesID | if a subset of genes is provided |
| correction | Multiple testing correction procedure |

## Value

An named numeric vector of $p$-values.

## Author(s)

Adrian Alexa

## See Also

GOKSTest, groupStats-class, getSigGroups-methods

## Examples

```
library(ALL)
data(ALL)
## discriminate B-cell from T-cell
classLabel <- as.integer(sapply(ALL$BT, function(x) return(substr(x, 1, 1) == 'T')))
## Differentially expressed genes
geneList <- getPvalues(exprs(ALL), classlabel = classLabel,
        alternative = "greater", correction = "BY")
hist(geneList, 50)
```

```
getSigGroups Interfaces for running the enrichment tests
```

## Description

These function are used for dispatching the specific algorithm for a given topGOdata object and a test statistic.

## Usage

```
getSigGroups(object, test.stat, ...)
runTest(object, algorithm, statistic, ...)
whichAlgorithms()
whichTests()
```

## Arguments

| object | An object of class topGOdata This object contains all data necessary for runnig <br> the test. |
| :--- | :--- |
| test.stat | An object of class groupStats. This object defines the test statistic. |
| algorithm | Character string specifing which algorithm to use. |
| statistic | Character string specifing which test to use. |
| $\ldots$ | Other parameters. In the case of runTest they are used for defining the test <br> statistic |

## Details

The runTest function can be used only with a predefined set of test statistics and algorithms. The algorithms and the statistical tests which are accessible via the runTest function are shown by the whichAlgorithms() and whichTests() functions.

The runTest function is a warping of the getSigGroups and the initialisation of a groupStats object functions.

## Value

An object of class topGOresult.

## Author(s)

Adrian Alexa

## See Also

```
topGOdata-class,groupStats-class, topGOresult-class
```

## Examples

```
## load a sample topGOdata object
data(GOdata)
GOdata
##############################
## getSigGroups interface
###############################
## define a test statistic
test.stat <- new("classicCount", testStatistic = GOFisherTest, name = "Fisher test")
## perform the test
resultFis <- getSigGroups(GOdata, test.stat)
resultFis
```

```
##############################
## runTest interface
###############################
## Enrichment analysis by using the "classic" method and Fisher's exact test
resultFis <- runTest(GOdata, algorithm = "classic", statistic = "fisher")
resultFis
## weight01 is the default algorithm
weight01.fisher <- runTest(GOdata, statistic = "fisher")
weight01.fisher
## not all combinations are possible!
# weight.ks <- runTest(GOdata, algorithm = "weight", statistic = "t")
```

## GOdata Sample topGOdata and topGOresult objects

## Description

The GOdata contains an instance of a topGOdata object. It can be used to run an enrichment analysis directly.

The resultFisher contains the results of an enrichment analysis.

## Usage

data(GOdata)

## Source

Generated using the ALL gene expression data. See topGOdata-class for code examples on how-to generate such an object.

## Examples

```
data(GOdata)
## print the object
GOdata
data(results.tGO)
## print the object
resultFisher
```

## groupGOTerms Grouping of GO terms into the three ontologies

## Description

This function split the GOTERM environment into three different ontologies. The newly created environments contain each only the terms from one of the following ontologies ' BP ', ' CC ', ' MF '

## Usage

groupGOTerms(where)

## Arguments

where The the environment where you want to bind the results.

## Value

The function returns NULL.

groupStats-class Class "groupStats"
```

## Description

A virtual class containing basic gene set information: the gene universe, the member of the current group, the test statistic defined for this group, etc.

## Objects from the Class

A virtual Class: No objects may be created from it

## Slots

name: Object of class "character" ~~
allMembers: Object of class "character" ~~
members: Object of class "character" ~~
testStatistic: Object of class "function" ~~
testStatPar: Object of class "ANY" ~~

## Methods

allMembers<- signature(object = "groupStats"):
allMembers signature(object = "groupStats"): ..
initialize signature(.Object = "groupStats"):
members<- signature(object = "groupStats"):
members signature(object = "groupStats"): ...
Name<- signature(object = "groupStats"):

inducedGraph The subgraph induced by a set of nodes.

## Description

Given a set of nodes (GO terms) this function is returning the subgraph containing these nodes and their ancestors.

## Usage

inducedGraph(dag, startNodes)
nodesInInducedGraph(dag, startNodes)

## Arguments

| dag | An object of class graphNEL containing a directed graph. |
| :--- | :--- |
| startNodes | A character vector giving the starting nodes. |

## Value

An object of class graphNEL-class is returned.

## Examples

```
data(GOdata)
## the GO graph
g <- graph(GOdata)
g
## select 10 random nodes
sn <- sample(nodes(g), 10)
## the subgraph induced by these nodes
sg <- inducedGraph(g, sn)
sg
```

```
parentChild-class Classes "parentChild" and "pC"
```

## Description

Classes that extend the "classicCount" class by adding support for the parent-child test.

## Objects from the Class

Objects can be created by calls of the form new("parentChild", testStatistic, name, groupMembers, parents, sigM

## Slots

splitIndex: Object of class "integer" ~~
joinFun: Object of class "character" ~~
significant: Object of class "integer" ~~
name: Object of class "character" ~~
allMembers: Object of class "character" ~~
members: Object of class "character" ~~
testStatistic: Object of class "function" ~~
testStatPar: Object of class "list" ~~

## Extends

Class "classicCount", directly. Class "groupStats", by class "classicCount", distance 2.

## Methods

updateGroup signature (object = "parentChild", name = "missing", members = "character"):

## Author(s)

Adrian Alexa

## See Also

```
classicCount-class, groupStats-class, getSigGroups-methods
```

## Examples

```
showClass("parentChild")
```

showClass("pC")

```
printGraph-methods Visualisation functions
```

## Description

Functions to plot the subgraphs induced by the most significant GO terms

## Usage

```
showSigOfNodes(GOdata, termsP.value, firstSigNodes = 10, reverse = TRUE,
    sigForAll = TRUE, wantedNodes = NULL, putWN = TRUE,
    putCL = 0, type = NULL, showEdges = TRUE, swPlot = TRUE,
        useFullNames = TRUE, oldSigNodes = NULL, useInfo = c("none", "pval", "counts", "def", "np
    plotFunction = GOplot, .NO.CHAR = 20)
printGraph(object, result, firstSigNodes, refResult, ...)
```

## Arguments

object an object of class topGOdata.
GOdata an object of class topGOdata.
result an object of class topGOresult.
firstSigNodes the number of top scoring GO terms which ....
refResult an object of class topGOresult.
termsP. value named vector of p -values.
reverse the direction of the edges.
sigForAll if TRUE the score/p-value of all nodes in the DAG is shown, otherwise only the score for the sigNodes
wantedNodes the nodes that we want to find, we will plot this nodes with a different color. The vector contains the names of the nodes
putWN the graph is generated with using the firstSigNodes and the wantedNodes.
putCL we generate the graph from the nodes given by all previous parameters, plus their children. if putCL $=1$ than only the children are added, if putCL $=n$ we get the nodes form the next $n$ levels.
type used for ploting pie charts
showEdges if TRUE the edge are shown
swPlot if true the graph is ploted, if not no ploting is done.
useInfo aditional info to be ploted to each node.

```
oldSigNodes used to plot the (new) sigNodes in the same collor range as the old ones
useFullNames
argument for internal use ..
plotFunction argument for internal use .
.NO.CHAR argument for internal use ..
... Extra arguments for printGraph can be:
fn.prefix character string giving the file name prefix.
useInfo as in showSigOfNodes function.
pdfSW logical attribute switch between PDF or PS formats.
```

## Details

There are two functions available. The showSigOfNodes will plot the induced subgraph to the current graphic device. The printGraph is a warping function for showSigOfNodes and will save the resulting graph into a PDF or PS file.
In the plots, the significant nodes are represented as rectangles. The plotted graph is the upper induced graph generated by these significant nodes.

## Not run:
data(GOdata)
data(results.tGO)
showSigOfNodes(GOdata, score(resultFisher), firstSigNodes = 5, useInfo = 'all')
printGraph(GOdata, resultFisher, firstSigNodes = 5, fn.prefix = "sampleFile", useInfo = "all", pdfSW = TRUE)
## End(Not run)
```

```
topGOdata-class Class "topGOdata"
```

## Description

TODO: The node attributes are environments containing the genes/probes annotated to the respective node

If genes is a numeric vector than this should represent the gene's score. If it is factor it should discriminate the genes in interesting genes and the rest

TODO: it will be a good idea to replace the allGenes and allScore with an ExpressionSet class. In this way we can use tests like global test, globalAncova.... - ALL variables starting with . are just for internal class usage (private)

## Objects from the Class

Objects can be created by calls of the form new("topGOdata", ontology, allGenes, geneSelectionFun, description ~~ describe objects here ~~

## Slots

topGOresult-class

Class "topGOresult"

## Description

Class instance created by getSigGroups-methods or by runTest

## Objects from the Class

Objects can be created by calls of the form new("topGOresult", description, score, testName, algorithm, geneDat

## Slots

description: character string containing a short description on how the object was build.
score: named numerical vector containing the p-values or the scores of the tested GO terms.
testName: character string containing the name of the test statistic used.
algorithm: character string containing the name of the algorithm used.
geneData: list containing summary statistics on the genes/gene universe/annotations.

## Methods

score: method to access the score slot.
testName: method to access the testName slot.
algorithm: method to access the algorithm slot.
geneData: method to access the geneData slot.
show: method to print the object
combineResults: method to aggregate two or more topGOresult objects. method = c("gmean" , "mean" , "median" , "mi provides the way the object scores (which most of the time are p-values) are combined..
