

# Package ‘Dcurvature’

May 28, 2026

**Type** Package

**Title** Discrete Curvature with 'shiny' Explorer

**Version** 0.0.3

**Description** Implements discrete curvature estimation for ordered planar point sequences using circumcenter geometry on consecutive triplets, exposed through compiled C plus plus (C++) code via 'Rcpp' for speed and numerical robustness. The package is useful for objective elbow detection in multivariate workflows, especially principal component analysis (PCA), where selecting the number of retained components can be subjective. It provides a 'shiny' interface that supports upload of raw datasets or explained-variance tables, computes Kaiser-Meyer-Olkin (KMO) sampling-adequacy diagnostics, evaluates individual and cumulative variance curves, and reports curvature-based decision rules ( $m^*$  and  $m^{**}$ ) with visual summaries for reproducible component-selection decisions.

curvature	<i>Discrete Curvature for an Ordered 2D Curve</i>
-----------	---------------------------------------------------

---

## Description

Compute pointwise discrete curvature from an ordered sequence of 2D points using circumcenter-based geometry on consecutive triplets.

## Usage

```
curvature(data)
```

## Arguments

data	A numeric matrix/data frame with at least two columns representing ordered x and y coordinates. Additional columns are ignored.
------	---------------------------------------------------------------------------------------------------------------------------------

## Value

A numeric vector of curvature values with one value per input row. Boundary points are set to 0.

**Examples**

```
pts <- cbind(  
  x = seq(0, 1, length.out = 8),  
  y = sin(seq(0, pi, length.out = 8))  
)  
curvature(pts)
```

---

load_example_data	<i>Load the bundled example data as a data frame</i>
-------------------	------------------------------------------------------

---

**Description**

Reads 'data.xlsx' from the package via [read\\_excel](#).

**Usage**

```
load_example_data(sheet = NULL, ...)
```

**Arguments**

sheet	Sheet to read; passed to <a href="#">read_excel</a> . Default is the first sheet.
...	Optional arguments passed to <a href="#">read_excel</a> .

**Value**

A data frame.

**Examples**

```
x <- load_example_data()  
head(x)
```

---

run_curvature_app	<i>Run the curvature Shiny app</i>
-------------------	------------------------------------

---

**Description**

Launches the discrete-curvature criterion app. You can start from an explained-variance table (upload CSV/Excel or use the bundled example), or from raw variables (Excel, then PCA). Elbow detection uses [curvature](#) on the variance curves, with optional KMO in PCA mode.

**Usage**

```
run_curvature_app(..., .runApp = shiny::runApp)
```

**Arguments**

... Optional arguments passed to [runApp](#) (e.g. port, launch.browser, host).  
.runApp Internal app runner used for testing. Defaults to [runApp](#).

**Value**

Invisibly returns the result of `shiny::runApp`. Called for its side effect of starting a Shiny app.

**Examples**

```
if (interactive()) {  
  run_curvature_app()  
}
```
