SWATH2stats example script

Example R code showing the usage of the SWATH2stats package. The data processed is the publicly available dataset of *S.pyogenes* (Röst et al. 2014) (http://www.peptideatlas.org/PASS/PASS00289). The results file 'rawOpenSwathResults_1pcnt_only.tsv' can be found on PeptideAtlas (ftp://PASS00289@ftp.peptideatlas.org/../Spyogenes/results/). This is a R Markdown file, showing the result of processing this data. The lines shaded in grey represent the R code executed during this analysis.

The SWATH2stats package can be directly installed from Bioconductor using the commands below (http://bioconductor.org/packages/devel/bioc/html/SWATH2stats.html).

```r
if (!require("BiocManager"))
    install.packages("BiocManager")
BiocManager::install("SWATH2stats")
```

Part 1: Loading and annotation

Load the SWATH-MS example data from the package, this is a reduced file in order to limit the file size of the package.

```r
library(SWATH2stats)
library(data.table)
data('Spyogenes', package = 'SWATH2stats')
```

Alternatively the original file downloaded from the Peptide Atlas can be loaded from the working directory.

```r
data <- data.frame(fread('rawOpenSwathResults_1pcnt_only.tsv', sep='\t', header=TRUE))
```

Extract the study design information from the file names. Alternatively, the study design table can be provided as an external table.

```r
Study_design <- data.frame(Filename = unique(data$align_origfilename))
Study_design$Filename <- gsub(".*strep_align/(.*)_all_peakgroups.*", "\\1", Study_design$Filename)
Study_design$Condition <- gsub("(Strep.*)_Repl.*", "\\1", Study_design$Filename)
Study_design$BioReplicate <- gsub(".*Repl([[:digit:]])_.*", "\\1", Study_design$Filename)
Study_design$Run <- seq_len(nrow(Study_design))
head(Study_design)
```

```
##                                      Filename Condition BioReplicate Run
## 1   Strep0_Repl1_R02/split_hroest_K120808     Strep0              1   1
## 2   Strep0_Repl2_R02/split_hroest_K120808     Strep0              2   2
## 3  Strep10_Repl1_R02/split_hroest_K120808    Strep10              1   3
## 4  Strep10_Repl2_R02/split_hroest_K120808    Strep10              2   4
```

The SWATH-MS data is annotated using the study design table.

```r
data.annotated <- sample_annotation(data, Study_design, column_file = "align_origfilename")
```

Remove the decoy peptides for a subsequent inspection of the data.

```r
data.annotated.nodecoy <- subset(data.annotated, decoy==FALSE)
```

Part 2: Analyze correlation, variation and signal
Count the different analytes for the different injections.

```
count_analytes(data.annotated.nodecoy)
```

```
##          run_id transition_group_id FullPeptideName ProteinName
## 1  Strep0_1_1                10229            8377        1031
## 2  Strep0_2_2                 9716            7970        1003
## 3 Strep10_1_3                 8692            7138         943
## 4 Strep10_2_4                 8424            6941         910
```
Plot the correlation of the signal intensity.

```
correlation <- plot_correlation_between_samples(data.annotated.nodecoy, column.values = 'Intensity')
```

Plot the correlation of the delta_rt, which is the deviation of the retention time from the expected retention time.

```
correlation <- plot_correlation_between_samples(data.annotated.nodecoy, column.values = 'delta_rt')
```

Plot the variation of the signal across replicates.

```
variation <- plot_variation(data.annotated.nodecoy)
```
cv across conditions

```
variation[[2]]
```

```
##   Condition   mode_cv   mean_cv median_cv
## 1    Strep0 0.2280372 0.2545450 0.2351859
## 2   Strep10 0.1706934 0.2947144 0.2592725
```

Plot the total variation versus variation within replicates.

```
variation_total <- plot_variation_vs_total(data.annotated.nodecoy)
```

coefficient of variation – total versus within replicates

```
variation_total[[2]]
```

```
##       scope   mode_cv   mean_cv median_cv
## 1 replicate 0.2209867 0.2728681 0.2438041
## 2     total 0.2655678 0.3439050 0.3139993
```

Calculate the summed signal per peptide and protein across samples.

```
peptide_signal <- write_matrix_peptides(data.annotated.nodecoy)
protein_signal <- write_matrix_proteins(data.annotated.nodecoy)
head(protein_signal)
```
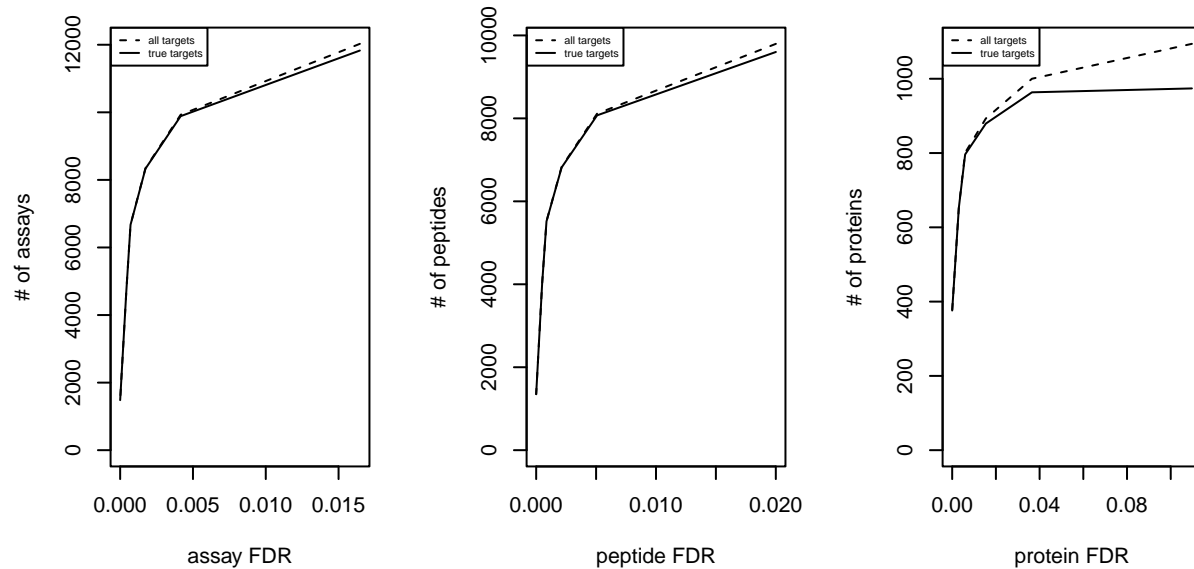

```
##                     ProteinName Strep0_1_1 Strep0_2_2 Strep10_1_3 Strep10_2_4
## 1  Spyo_Exp3652_DDB_SeqID_1571119     265206     163326       51831       45021
## 2  Spyo_Exp3652_DDB_SeqID_1579753     185725     150672       21483      144314
```

```
## 3  Spyo_Exp3652_DDB_SeqID_1631459    176686  132415   42165   32735
## 4  Spyo_Exp3652_DDB_SeqID_1640263      3310    6617   98550   45169
## 5  Spyo_Exp3652_DDB_SeqID_1709452    852502  747772  503581  504761
## 6 Spyo_Exp3652_DDB_SeqID_17244480     17506   29578    7607    2482
```
Part 3: FDR estimation

Estimate the overall FDR across runs using a target decoy strategy.

```
par(mfrow = c(1, 3))
fdr_target_decoy <- assess_fdr_overall(data.annotated, n_range = 10,
                                       FFT = 0.25, output = 'Rconsole')
```

Global m−score cutoff connectivity to FDR quality

According to this FDR estimation one would need to filter the data with a lower mscore threshold to reach an overall protein FDR of 5%.

```
mscore4protfdr(data, FFT = 0.25, fdr_target = 0.05)
```

```
## Target protein FDR:0.05

## Required overall m-score cutoff:0.0017783
## achieving protein FDR =0.0488

## [1] 0.001778279
```

5

Part 4: Filtering

Filter data for values that pass the 0.001 mscore criteria in at least two replicates of one condition.

```
data.filtered <- filter_mscore_condition(data.annotated, 0.001, n_replica = 2)
```

```
## Fraction of peptides selected: 0.67
```

```
## Dimension difference: 7226, 0
```

Select only the 10 peptides showing strongest signal per protein.

```
data.filtered2 <- filter_on_max_peptides(data.filtered, n_peptides = 10)
```

```
## Before filtering:
##    Number of proteins: 884
##    Number of peptides: 6594
##
## Percentage of peptides removed: 29.6%
##
## After filtering:
##    Number of proteins: 884
##    Number of peptides: 4642
```

Filter for proteins that are supported by at least two peptides.

```
data.filtered3 <- filter_on_min_peptides(data.filtered2, n_peptides = 2)
```

```
## Before filtering:
##    Number of proteins: 884
##    Number of peptides: 4642
##
## Percentage of peptides removed: 3.6%
##
## After filtering:
##    Number of proteins: 717
##    Number of peptides: 4475
```

Part 5: Conversion

Convert the data into a transition-level format (one row per transition measured).

```
data.transition <- disaggregate(data.filtered3)
```

```
## The library contains 6 transitions per precursor.
##
## The data table was transformed into a table containing one row per transition.
```

Convert the data into the format required by MSstats.

```
MSstats.input <- convert4MSstats(data.transition)
```

```
## One or several columns required by MSstats were not in the data.
##                 The columns were created and filled with NAs.
## Missing columns: ProductCharge, IsotopeLabelType
```

```
## IsotopeLabelType was filled with light.
```

```
## Warning in convert4MSstats(data.transition): Intensity values that were 0, were
## replaced by NA
```

```
head(MSstats.input)
```

```
