Package 'bioDist'

February 20, 2025

Title Different distance measures

Version 1.79.0

Author B. Ding, R. Gentleman and Vincent Carey

Description A collection of software tools for calculating distance measures.

Maintainer Bioconductor Package Maintainer

closest.top   *Find the closest genes.*

Description

Find the closest genes to the supplied target gene based on the supplied distances.

Usage

```
closest.top(x, dist.mat, top)
```

Arguments

x	the name of the gene (feature) to use.
dist.mat	either a dist object or a matrix of distances.
top	the number of closest genes desired.

Details

The feature named x must be in the supplied distances. If so, then the top closest other features are returned.

Value

A vector of names of the top closest features.

Author(s)

Beiying Ding

See Also

cor.dist, spearman.dist, tau.dist, euc, man, KLdist.matrix, KLD.matrix, mutualInfo

Examples

```
data(sample.ExpressionSet)
sE <- sample.ExpressionSet[1:100,]
d1 <- KLdist.matrix(sE, sample = FALSE)
closest.top(featureNames(sE)[1], d1, 5)
```

---

cor.dist	*Pearson correlational distance*

Description

Calculate pairwise Pearson correlational distances, i.e. 1-COR or 1-|COR|, and saves as a 'dist' object

Usage

```
cor.dist(x, ...)
```

Arguments

x   n by p matrix or ExpressionSet; if x is an ExpressionSet, then the function uses its 'exprs' slot.

...   arguments passed to `cor.dist`:

- absif TRUE, then 1-|COR| else 1-COR, default is TRUE.
- diagif TRUE, then the diagonal of the distance matrix will be displayed, default is FALSE.
- upperif TRUE, then the upper triangle of the distance matrix will be displayed, default is FALSE.
- samplefor objects of classes that extend eSet: if TRUE, then distances are computed between samples(columns) , otherwise, they are computed between features(rows).

Details

The `cor` function is used to compute the pairwise distances between rows of an input matrix, except if the input is an object of a class that extends eSet and `sample` is TRUE.

Value

Pairwise Pearson correlational distance object

Author(s)

Beiying Ding

Examples

```
x <- matrix(rnorm(200), nrow = 5)
cor.dist(x)
```

---

euc   *Euclidean distance*

Description

Calculate pairwise Euclidean distances and saves the result as a 'dist' object

Usage

```
euc(x, ...)
```

Arguments

x   n by p matrix or an object of a class that extends eSet; if x is a matrix, pairwise
             distances are calculated between the rows of a matrix. If x is an object of a class
             that extends eSet, the method makes use of the 'exprs' method and pairwise
             distances are calculated between samples(columns) if sample is TRUE

...   arguments passed to euc:

             • diagif TRUE, then the diagonal of the distance matrix will be displayed;
               default is FALSE.
             • upperif TRUE, then the upper triangle of the distance matrix will be dis-
               played; default is FALSE.
             • sampleFor objects of classes that extends eSet, pairwise distances are cal-
               culated between samples(columns) if sample is TRUE ; default value is
               TRUE

Details

The method calculates pairwise euclidean distances, assuming that all samples have the same num-
ber of observations

Value

An object of class dist with the pairwise Euclidean distance between rows except in case of objects
of class that extend eSet when sample is TRUE

Author(s)

Beiying Ding

See Also

[spearman.dist](), [tau.dist](), [man](),[KLdist.matrix](),[KLD.matrix](), [mutualInfo]()

Examples

```
x <- matrix(rnorm(200), nrow = 5)
euc(x)
```

KLD.matrix *Continuous version of Kullback-Leibler Distance (KLD)*

Description

Calculate KLD by estimating by smoothing $\log(f(x)/g(x)) * f(x)$ and then integrating.

Usage

```
KLD.matrix(x, ...)
```

Arguments

x   n by p matrix or list or an object of a class that extends eSet; if x is an an object
              of a class that extends eSet (eg ExpressionSet), then the function works against
              its 'exprs' slot.

...   arguments passed to `KLD.matrix`:

  - methoduse `locfit` or `density` to estimate integrand; default is c("locfit",
    "density")(i.e. both methods).
  - suppupper and lower limits of the integral; default is NULL in which case
    the limits of the integral are calculated from the range of the data.
  - subdivisionssubdivisions for the integration; default is 1000.
  - diagif TRUE, then the diagonal of the distance matrix will be displayed;
    default is FALSE.
  - upperif TRUE, then the upper triangle of the distance matrix will be dis-
    played; default is FALSE.
  - samplefor ExpressionSet methods: if TRUE, then distances are computed
    between samples, otherwise, they are computed between genes.

Details

The distance is computed between rows of the input matrix (except if the input is an object of a
class that extends eSet and `sample` is `TRUE`.

The presumption is that all samples have the same number of observations. The list method is meant
for use when samples sizes are unequal.

Value

An object of class `dist` with the pairwise, between rows, Kullback-Leibler distances.

Author(s)

Beiying Ding, Vincent Carey

See Also

cor.dist, spearman.dist, tau.dist, dist, KLdist.matrix, mutualInfo

Examples

```
x <- matrix(rnorm(100), nrow = 5)
KLD.matrix(x, method = "locfit", supp = range(x))
```

KLdist.matriX   *Discrete version of Kullback-Leibler Distance (KLD)*

Description

Calculate the KLD by binning continuous data.

KL distance is calculated using the formula

$$KLD(f_1(x), f_2(x)) = \sum_{i=1}^{N} f_1(x_i) * \log \frac{f_1(x_i)}{f_2(x_i)}$$

Usage

```
KLdist.matrix(x, ...)
```

Arguments

x   n by p matrix or a list or an object of a class that extends eSet. If x is an object of
                  a class derived from eSet (ExpressionSet,SnpSet etc), then the values returned
                  by the exprs function are used.

...   arguments passed to KLdist.matrix:

                  gridsize the number of grid points used to select the optimal bin width of the
                      histogram used to estimate density. If no value is supplied, the grid size is
                      calculated internally; default is NULL.

                  symmetrize if TRUE, then symmetrize; the default is FALSE.

                  diag if TRUE, then the diagonal of the distance matrix will be displayed; the
                      default is FALSE.

                  upper if TRUE, then the upper triangle of the distance matrix will be displayed;
                      default is FALSE.

                  sample for eSet methods: if TRUE, then the distances are computed between
                      samples, otherwise, between features; the default is TRUE.

Details

The data are binned, and then the KL distance between the two discrete distributions is computed
and used. The distance is computed between rows of the input matrix (except if the input is an
object of a class that extends eSet and sample is TRUE.

The presumption is that all samples have the same number of observations. The list method is meant
for use when samples sizes are unequal.

Value

An object of class `dist` is returned.

KLdist.matrix(x, symmetrize = TRUE)
```

---

man   *Manhattan distance*

Description

Calculate pairwise Manhattan distances and saves as a `dist` object.

Usage

```
man(x, ...)
```

Arguments

x   n by p matrix or an object of class that extends eSet. If x is an object of class
                 that extends eSet, (eg ExpressionSet) then the function uses its 'exprs' slot.

...   arguments passed to `man`:

   - diagif `TRUE`, then the diagonal of the distance matrix will be displayed;
     default is FALSE.
   - upperif `TRUE`, then the upper triangle of the distance matrix will be dis-
     played; default is FALSE.

Details

This is just an interface to `dist` with the right parameters set.

Value

An instance of the `dist` class with the pairwise Manhattan distances between the rows of x in case
of a matrix or between the features (rows) in case of a class that extends eSet.

Author(s)

Beiying Ding

Examples

```
x <- matrix(rnorm(200), nrow = 5)
man(x)
```

---

mutualInfo   *Mutual Information*

Description

Calculate mutual information via binning

Usage

```
mutualInfo(x, ...)
MIdist(x, ...)
```

Arguments

x   an n by p matrix or ExpressionSet; if x is an ExpressionSet, then the function
                  uses its 'exprs' slot.

...   arguments passed to `mutualInfo` and `MIdist`:

                  • nbinnumber of bins to calculate discrete probabilities; default is 10.
                  • diagif TRUE, then the diagonal of the distance matrix will be displayed;
                    default is FALSE.
                  • upperif TRUE, then the upper triangle of the distance matrix will be dis-
                    played; default is FALSE.
                  • samplefor ExpressionSet methods, if TRUE, then distances are computed
                    between samples, otherwise, between genes.

Details

For `mutualInfo` each row of x is divided into `nbin` groups and then the mutual information is
computed, treating the data as if they were discrete.

For `MIdist` we use the transformation proposed by Joe (1989), $\delta^* = (1 - \exp(-2\delta))^{1/2}$ where δ
is the mutual information. The `MIdist` is then $1 = \delta^*$. Joe argues that this measure is then similar
to Kendall's tau, [tau.dist]().

Value

An object of class dist which contains the pairwise distances.

Author(s)

Robert Gentleman

Examples

```
 x <- matrix(rnorm(100), nrow = 5)
 mutualInfo(x, nbin = 3)
```

---

spearman.dist   *Spearman correlational distance*

Description

Calculate pairwise Spearman correlational distances, i.e. 1-SPEAR or 1-|SPEAR|, for all rows of a matrix and return a dist object.

Usage

```
 spearman.dist(x, ...)
```

Arguments

x   n by p matrix or ExpressionSet; if x is an ExpressionSet, then the function uses
             its 'exprs' slot.

...   arguments passed to spearman.dist:

             • absif TRUE, then 1-|SPEAR| else 1-SPEAR; default is TRUE.
             • diagif TRUE, then the diagonal of the distance matrix will be displayed;
               default is FALSE.
             • upperif TRUE, then the upper triangle of the distance matrix will be dis-
               played; default is FALSE.
             • samplefor the ExpressionSet method: if TRUE (the default), then distances
               are computed between samples.

Details

We call `cor` with the appropriate arguments to compute the row-wise correlations.

Value

One minus the Spearman correlation, between rows of x, are returned, as an instance of the `dist` class.

Examples

```
x <- matrix(rnorm(200), nrow = 5)
spearman.dist(x)
```

---

tau.dist   *Kendall's tau correlational distance*

Description

Calculate pairwise Kendall's tau correlational distances, i.e. 1-TAU or 1-|TAU|, for all rows of the input matrix and return an instance of the `dist` class.

Usage

```
tau.dist(x, ...)
```

Arguments

x   n by p matrix or ExpressionSet; if x is an ExpressionSet, then the function uses
                its 'exprs' slot.

...   arguments passed to `tau.dist`:

                • absif TRUE, then 1-|TAU| else 1-TAU; default is TRUE.
                • diagif TRUE, then the diagonal of the distance matrix will be displayed;
                  default is FALSE.
                • upperif TRUE, then the upper triangle of the distance matrix will be dis-
                  played; default is FALSE.
                • samplefor the ExpressionSet method: if TRUE (the default), then distances
                  are computed between samples.

Details

Row-wise correlations are computed by calling the cor function with the appropriate arguments.

Value

One minus the row-wise Kendall's tau correlations are returned as an instance of the dist class. Note that this can be extremely slow for large data sets.
