Package 'txdbmaker'

February 2, 2026

Title Tools for making TxDb objects from genomic annotations

Description A set of tools for making TxDb objects from genomic annotations
from various sources (e.g. UCSC, Ensembl, and GFF files). These tools
allow the user to download the genomic locations of transcripts,
exons, and CDS, for a given assembly, and to import them in a TxDb
object. TxDb objects are implemented in the GenomicFeatures package,
together with flexible methods for extracting the desired features in
convenient formats.

txdbmaker-package *Tools for making TxDb objects from genomic annotations*

Description

The **txdbmaker** package contains a set of tools for making TxDb objects from genomic annotations from various sources (e.g. UCSC, Ensembl, and GFF files). These tools allow the user to download the genomic locations of transcripts, exons, and CDS, for a given assembly, and to import them in a TxDb object.

Note that TxDb objects are implemented in the **GenomicFeatures** package, together with flexible methods for extracting the desired features in convenient formats.

Details

For a quick overview of the provided tools, please see the "Making TxDb Objects" vignette included in this package.

To access the vignette from your R session, run browseVignettes(package="txdbmaker"). This requires the **txdbmaker** package to be already installed.

Alternatively this vignette should also be available online here: `https://bioconductor.org/packages/release/bioc/vignettes/txdbmaker/inst/doc/txdbmaker.html`

---

makeFeatureDbFromUCSC *Making a FeatureDb object from annotations available at the UCSC Genome Browser*

Description

WARNING: The FeatureDb/makeFeatureDbFromUCSC/features code base is no longer actively maintained and FeatureDb-related functionalities might get deprecated in the near future.

The makeFeatureDbFromUCSC function allows the user to make a FeatureDb object from simple annotation tracks at UCSC. The tracks in question must (at a minimum) have a start, end and a chromosome affiliation in order to be made into a FeatureDb. This function requires a precise declaration of its first three arguments to indicate which genome, track and table wish to be imported. There are discovery functions provided to make this process go smoothly.

Usage

```
UCSCFeatureDbTableSchema(genome,
                        track,
                        tablename)

makeFeatureDbFromUCSC(
        genome,
        track,
        tablename,
        columns = UCSCFeatureDbTableSchema(genome,track,tablename),
        url="https://genome.ucsc.edu/cgi-bin/",
        goldenPath.url=getOption("UCSC.goldenPath.url"),
        chromCol,
        chromStartCol,
        chromEndCol,
        taxonomyId=NA)
```

Arguments

genome	genome abbreviation used by UCSC and listed in list_UCSC_genomes()[, "genome"]. For example: "hg18".
track	Deprecated.

tablename	name of the UCSC table containing the annotations to retrieve. Use `list_UCSC_tracks` from the **UCSC.utils** package to get the list of available tracks and associated primary tables for a particular genome.
columns	a named character vector to list out the names and types of the other columns that the downloaded track should have. Use `UCSCFeatureDbTableSchema` to retrieve this information for a particular table.
url, goldenPath.url	
	Deprecated.
chromCol	If the schema comes back and the 'chrom' column has been labeled something other than 'chrom', use this argument to indicate what that column has been labeled as so we can properly designate it. This could happen (for example) with the knownGene track tables, which has no 'chromStart' or 'chromEnd' columns, but which DOES have columns that could reasonably substitute for these columns under particular circumstances. Therefore we allow these three columns to have arguments so that their definition can be re-specified
chromStartCol	Same thing as chromCol, but for renames of 'chromStart'
chromEndCol	Same thing as chromCol, but for renames of 'chromEnd'
taxonomyId	By default this value is NA and the organism inferred will be used to look up the correct value for this. But you can use this argument to override that and supply your own valid taxId here.

Details

`makeFeatureDbFromUCSC` is a convenience function that builds a tiny database from one of the UCSC track tables.

`UCSCFeatureDbTableSchema` is a convenience function that creates a named vector of types for all the fields that can potentially be supported for a given track. By default, this will be called on your specified tablename to include all of the fields in a track.

Value

A [FeatureDb](#) object for makeFeatureDbFromUCSC.

Author(s)

M. Carlson

See Also

[list_UCSC_genomes](#) and [list_UCSC_tracks](#) in the **UCSC.utils** package.

Examples

```
## Display the list of genomes available at UCSC:
library(UCSC.utils)
list_UCSC_genomes()[ , "genome"]

## Display the list of tracks available for your genome:
```

```
list_UCSC_tracks("mm10")

## Lookup the primary table associated with your track of interest:
subset(list_UCSC_tracks("mm10"), track == "qPCR Primers")

## Display fields that could be passed in to colnames:
UCSCFeatureDbTableSchema(genome="mm10",
                        tablename="qPcrPrimers")

## Retrieving a full transcript dataset for Mouse from UCSC:
fdb <- makeFeatureDbFromUCSC(genome="mm10",
                              tablename="qPcrPrimers")
fdb
```

---

makeTxDb *Making a TxDb object from user supplied annotations*

Description

makeTxDb is a low-level constructor for making a TxDb object from user supplied transcript annotations.

Note that the end user will rarely need to use makeTxDb directly but will typically use one of the high-level constructors makeTxDbFromUCSC, makeTxDbFromEnsembl, or makeTxDbFromGFF.

Usage

```
makeTxDb(transcripts, splicings, genes=NULL,
         chrominfo=NULL, metadata=NULL,
         reassign.ids=FALSE, on.foreign.transcripts=c("error", "drop"))
```

Arguments

transcripts	Data frame containing the genomic locations of a set of transcripts.
splicings	Data frame containing the genomic locations of exons and CDS parts of the transcripts in transcripts.
genes	Data frame containing the genes associated to a set of transcripts.
chrominfo	Data frame containing information about the chromosomes hosting the set of transcripts.
metadata	2-column data frame containing meta information about this set of transcripts like organism, genome, UCSC table, etc... The names of the columns must be "name" and "value" and their type must be character.
reassign.ids	TRUE or FALSE. Controls how internal ids should be assigned for each type of feature i.e. for transcripts, exons, and CDS parts. For each type, if reassign.ids is FALSE (the default) and if the ids are supplied, then they are used as the internal ids, otherwise the internal ids are assigned in a way that is compatible with the order defined by ordering the features first by chromosome, then by strand, then by start, and finally by end.

on.foreign.transcripts

> Controls what to do when the input contains *foreign transcripts* i.e. transcripts that are on sequences not in `chrominfo`. If set to `"error"` (the default)

Details

The `transcripts` (required), `splicings` (required) and `genes` (optional) arguments must be data frames that describe a set of transcripts and the genomic features related to them (exons, CDS parts, and genes at the moment). The `chrominfo` (optional) argument must be a data frame containing chromosome information like the length of each chromosome.

`transcripts` must have 1 row per transcript and the following columns:

- `tx_id`: Transcript ID. Integer vector. No NAs. No duplicates.
- `tx_chrom`: Transcript chromosome. Character vector (or factor) with no NAs.
- `tx_strand`: Transcript strand. Character vector (or factor) with no NAs where each element is either `"+"` or `"-"`.
- `tx_start`, `tx_end`: Transcript start and end. Integer vectors with no NAs.
- `tx_name`: [optional] Transcript name. Character vector (or factor). NAs and/or duplicates are ok.
- `tx_type`: [optional] Transcript type (e.g. mRNA, ncRNA, snoRNA, etc...). Character vector (or factor). NAs and/or duplicates are ok.
- `gene_id`: [optional] Associated gene. Character vector (or factor). NAs and/or duplicates are ok.

Other columns, if any, are ignored (with a warning).

`splicings` must have N rows per transcript, where N is the nb of exons in the transcript. Each row describes an exon plus, optionally, the CDS part associated with this exon. Its columns must be:

- `tx_id`: Foreign key that links each row in the `splicings` data frame to a unique row in the `transcripts` data frame. Note that more than 1 row in `splicings` can be linked to the same row in `transcripts` (many-to-one relationship). Same type as `transcripts$tx_id` (integer vector). No NAs. All the values in this column must be present in `transcripts$tx_id`.
- `exon_rank`: The rank of the exon in the transcript. Integer vector with no NAs. (`tx_id`, `exon_rank`) pairs must be unique.
- `exon_id`: [optional] Exon ID. Integer vector with no NAs.
- `exon_name`: [optional] Exon name. Character vector (or factor). NAs and/or duplicates are ok.
- `exon_chrom`: [optional] Exon chromosome. Character vector (or factor) with no NAs. If missing then `transcripts$tx_chrom` is used. If present then `exon_strand` must also be present.
- `exon_strand`: [optional] Exon strand. Character vector (or factor) with no NAs. If missing then `transcripts$tx_strand` is used and `exon_chrom` must also be missing.
- `exon_start`, `exon_end`: Exon start and end. Integer vectors with no NAs.
- `cds_id`: [optional] ID of the CDS part associated with the exon. Integer vector. If present then `cds_start` and `cds_end` must also be present. NAs are allowed and must match those in `cds_start` and `cds_end`.

- cds_name: [optional] Name of the CDS part. Character vector (or factor). If present then cds_start and cds_end must also be present. NAs and/or duplicates are ok. Must contain NAs at least where cds_start and cds_end contain them.

- cds_start, cds_end: [optional] Start/end of the CDS part. Integer vectors. If one of the 2 columns is missing then all cds_* columns must be missing. NAs are allowed and must occur at the same positions in cds_start and cds_end.

- cds_phase: [optional] Phase of the CDS part. Integer vector. If present then cds_start and cds_end must also be present. NAs are allowed and must match those in cds_start and cds_end.

Other columns, if any, are ignored (with a warning).

genes should not be supplied if transcripts has a gene_id column. If supplied, it must have N rows per transcript, where N is the nb of genes linked to the transcript (N will be 1 most of the time). Its columns must be:

- tx_id: [optional] genes must have either a tx_id or a tx_name column but not both. Like splicings$tx_id, this is a foreign key that links each row in the genes data frame to a unique row in the transcripts data frame.

- tx_name: [optional] Can be used as an alternative to the genes$tx_id foreign key.

- gene_id: Gene ID. Character vector (or factor). No NAs.

Other columns, if any, are ignored (with a warning).

chrominfo must have 1 row per chromosome and the following columns:

- chrom: Chromosome name. Character vector (or factor) with no NAs and no duplicates.

- length: Chromosome length. Integer vector with either all NAs or no NAs.

- is_circular: [optional] Chromosome circularity flag. Logical vector. NAs are ok.

Other columns, if any, are ignored (with a warning).

Value

A TxDb object.

Author(s)

Hervé Pagès

See Also

- makeTxDbFromUCSC, makeTxDbFromBiomart, and makeTxDbFromEnsembl, for making a TxDb object from online resources.

- makeTxDbFromGRanges and makeTxDbFromGFF for making a TxDb object from a GRanges object, or from a GFF or GTF file.

- TxDb objects implemented in the **GenomicFeatures** package.

- saveDb and loadDb in the **AnnotationDbi** package for saving and loading a TxDb object as an SQLite file.

Examples

```
transcripts <- data.frame(
                    tx_id=1:3,
                    tx_chrom="chr1",
                    tx_strand=c("-", "+", "+"),
                    tx_start=c(1, 2001, 2001),
                    tx_end=c(999, 2199, 2199))
splicings <-  data.frame(
                    tx_id=c(1L, 2L, 2L, 2L, 3L, 3L),
                    exon_rank=c(1, 1, 2, 3, 1, 2),
                    exon_start=c(1, 2001, 2101, 2131, 2001, 2131),
                    exon_end=c(999, 2085, 2144, 2199, 2085, 2199),
                    cds_start=c(1, 2022, 2101, 2131, NA, NA),
                    cds_end=c(999, 2085, 2144, 2193, NA, NA),
                    cds_phase=c(0, 0, 2, 0, NA, NA))

txdb <- makeTxDb(transcripts, splicings)
```

---

makeTxDbFromBiomart   *Make a TxDb object from annotations available on a BioMart*
                           database

Description

The makeTxDbFromBiomart function allows the user to make a [TxDb](#) object from transcript annotations available on a BioMart database.

Note that makeTxDbFromBiomart is being phased out in favor of [makeTxDbFromEnsembl](#).

Usage

```
makeTxDbFromBiomart(biomart="ENSEMBL_MART_ENSEMBL",
                    dataset="hsapiens_gene_ensembl",
                    transcript_ids=NULL,
                    circ_seqs=NULL,
                    filter=NULL,
                    id_prefix="ensembl_",
                    host="https://www.ensembl.org",
                    taxonomyId=NA)

getChromInfoFromBiomart(biomart="ENSEMBL_MART_ENSEMBL",
                        dataset="hsapiens_gene_ensembl",
                        id_prefix="ensembl_",
                        host="https://www.ensembl.org")
```

Arguments

biomart   which BioMart database to use. Get the list of all available BioMart databases
                   with the [listMarts](#) function from the biomaRt package. See the details section
                   below for a list of BioMart databases with compatible transcript annotations.

dataset   which dataset from BioMart. For example: `"hsapiens_gene_ensembl"`, `"mmusculus_gene_ensembl"`, `"dmelanogaster_gene_ensembl"`, `"celegans_gene_ensembl"`, etc in the ensembl database. See the examples section below for how to discover which datasets are available in a given BioMart database.

transcript_ids   optionally, only retrieve transcript annotation data for the specified set of transcript ids. If this is used, then the meta information displayed for the resulting [TxDb](#) object will say 'Full dataset: no'. Otherwise it will say 'Full dataset: yes'.

circ_seqs   a character vector to list out which chromosomes should be marked as circular.

filter   Additional filters to use in the BioMart query. Must be a named list. An example is `filter=list(source="entrez")`

id_prefix   Specifies the prefix used in BioMart attributes. For example, some BioMarts may have an attribute specified as `"ensembl_transcript_id"` whereas others have the same attribute specified as `"transcript_id"`. Defaults to `"ensembl_"`.

host   The host URL of the BioMart. Defaults to www.ensembl.org.

taxonomyId   By default this value is NA and the dataset selected will be used to look up the correct value for this. But you can use this argument to override that and supply your own taxId here (which will be independently checked to make sure its a real taxonomy id). Normally you should never need to use this.

Details

makeTxDbFromBiomart is a convenience function that feeds data from a BioMart database to the lower level [makeTxDb](#) function. See ?[makeTxDbFromUCSC](#) for a similar function that feeds data from the UCSC source.

Here is a list of datasets known to be compatible with makeTxDbFromBiomart (list updated on September 18, 2017):

1. All the datasets in the main Ensembl database. Get the list with:

   ```
   mart <- biomaRt::useEnsembl(biomart="ENSEMBL_MART_ENSEMBL",
                               host="https://www.ensembl.org")
   biomaRt::listDatasets(mart)
   ```

2. All the datasets in the Ensembl Fungi database. Get the list with:

   ```
   mart <- biomaRt::useEnsemblGenomes(biomart="fungi_mart")
   biomaRt::listDatasets(mart)
   ```

3. All the datasets in the Ensembl Metazoa database. Get the list with:

   ```
   mart <- biomaRt::useEnsemblGenomes(biomart="metazoa_mart")
   biomaRt::listDatasets(mart)
   ```

4. All the datasets in the Ensembl Plants database. Get the list with:

   ```
   mart <- biomaRt::useEnsemblGenomes(biomart="plants_mart")
   biomaRt::listDatasets(mart)
   ```

5. All the datasets in the Ensembl Protists database. Get the list with:

   ```
   mart <- biomaRt::useEnsemblGenomes(biomart="protists_mart")
   biomaRt::listDatasets(mart)
   ```

6. All the datasets in the Gramene Mart. Get the list with:

    ```
    mart <- biomaRt::useEnsembl(biomart="ENSEMBL_MART_PLANT",
                                host="https://ensembl.gramene.org")
    biomaRt::listDatasets(mart)
    ```

Note that BioMart is not currently available for Ensembl Bacteria.

Also please note that not all these datasets have CDS information.

Value

A [TxDb](#) object for makeTxDbFromBiomart.

A data frame with 1 row per chromosome (or scaffold) and with columns chrom and length for getChromInfoFromBiomart.

Author(s)

M. Carlson and H. Pagès

See Also

- [makeTxDbFromUCSC](#) and [makeTxDbFromEnsembl](#) for making a [TxDb](#) object from other online resources.

- [makeTxDbFromGRanges](#) and [makeTxDbFromGFF](#) for making a [TxDb](#) object from a [GRanges](#) object, or from a GFF or GTF file.

- The [listMarts](#), [useEnsembl](#), [listDatasets](#), and [listFilters](#) functions in the **biomaRt** package.

- [TxDb](#) objects implemented in the **GenomicFeatures** package.

- [makeTxDb](#) for the low-level function used by the makeTxDbFrom* functions to make the [TxDb](#) object returned to the user.

Examples

```
## ---------------------------------------------------------------------
## A. BASIC USAGE
## ---------------------------------------------------------------------

## We can use listDatasets() from the biomaRt package to list the
## datasets available in the "ENSEMBL_MART_ENSEMBL" BioMart database:
library(biomaRt)
listMarts(host="https://www.ensembl.org")
mart <- useEnsembl(biomart="ENSEMBL_MART_ENSEMBL", host="https://www.ensembl.org")
datasets <- listDatasets(mart)
head(datasets)
subset(datasets, grepl("elegans", dataset, ignore.case=TRUE))

## Retrieve the full transcript dataset for Worm:
txdb1 <- makeTxDbFromBiomart(dataset="celegans_gene_ensembl")
txdb1
```

```
## Retrieve an incomplete transcript dataset for Human:
transcript_ids <- c(
    "ENST00000013894",
    "ENST00000268655",
    "ENST00000313243",
    "ENST00000435657",
    "ENST00000384428",
    "ENST00000478783"
)

if (interactive()) {
  txdb2 <- makeTxDbFromBiomart(dataset="hsapiens_gene_ensembl",
                               transcript_ids=transcript_ids)
  txdb2  # note that these annotations match the GRCh38 genome assembly
}

## ----------------------------------------------------------------------
## B. ACCESSING THE EnsemblGenomes MARTS
## ----------------------------------------------------------------------

library(biomaRt)

## Note that BioMart is not currently available for Ensembl Bacteria.

## --------------------
## --- Ensembl Fungi ---

mart <- useEnsemblGenomes(biomart="fungi_mart")
datasets <- listDatasets(mart)
datasets$dataset
yeast_txdb <- makeTxDbFromBiomart(biomart="fungi_mart",
                                  dataset="scerevisiae_eg_gene",
                                  host="https://fungi.ensembl.org")
yeast_txdb

## ----------------------
## --- Ensembl Metazoa ---

## The metazoa mart is slow and at the same time it doesn't seem to
## support requests that take more than 1 min at the moment. So a call to
## biomaRt::getBM() will fail with a "Timeout was reached" error if the
## requested data takes more than 1 min to download. This unfortunately
## happens with the example below so we don't try to run it for now.

  mart <- useEnsemblGenomes(biomart="metazoa_mart")
  datasets <- listDatasets(mart)
  datasets$dataset
  worm_txdb <- makeTxDbFromBiomart(biomart="metazoa_mart",
                                   dataset="celegans_eg_gene",
                                   host="https://metazoa.ensembl.org")
  worm_txdb
```

```
  ## Note that even if the dataset for Worm on Ensembl Metazoa contains
  ## the same transcript as on the main Ensembl database, the transcript
  ## type might be annotated with slightly different terms (e.g. antisense
  ## vs antisense_RNA):
  filter <- list(tx_name="Y71G12B.44")
  transcripts(worm_txdb, filter=filter, columns=c("tx_name", "tx_type"))
  transcripts(txdb1, filter=filter, columns=c("tx_name", "tx_type"))

## ---------------------
## --- Ensembl Plants ---

## Like the metazoa mart (see above), the plants mart is also slow and
## doesn't seem to support requests that take more than 1 min either.
## So we don't try to run the example below for now.

mart <- useEnsemblGenomes(biomart="plants_mart")
datasets <- listDatasets(mart)
datasets[ , 1:2]
athaliana_txdb <- makeTxDbFromBiomart(biomart="plants_mart",
                                      dataset="athaliana_eg_gene",
                                      host="https://plants.ensembl.org")
athaliana_txdb

## -----------------------
## --- Ensembl Protists ---

mart <- useEnsemblGenomes(biomart="protists_mart")
datasets <- listDatasets(mart)
datasets$dataset
tgondii_txdb <- makeTxDbFromBiomart(biomart="protists_mart",
                                    dataset="tgondii_eg_gene",
                                    host="https://protists.ensembl.org")
tgondii_txdb

## ---------------------------------------------------------------------
## C. USING AN Ensembl MIRROR
## ---------------------------------------------------------------------

## You can use the 'host' argument to access the "ENSEMBL_MART_ENSEMBL"
## BioMart database at a mirror (e.g. at uswest.ensembl.org). A gotcha
## when doing this is that the name of the database on the mirror might
## be different! We can check this with listMarts() from the biomaRt
## package:
if (interactive()) {

  listMarts(host="https://useast.ensembl.org")

  txdb3 <- makeTxDbFromBiomart(biomart="ENSEMBL_MART_ENSEMBL",
                               dataset="hsapiens_gene_ensembl",
                               transcript_ids=transcript_ids,
                               host="https://useast.ensembl.org")
  txdb3
```

```
  }
  ## Therefore in addition to setting 'host' to "uswest.ensembl.org", we
  ## might also need to specify the 'biomart' argument.

  ## ---------------------------------------------------------------------
  ## D. USING FILTERS
  ## ---------------------------------------------------------------------

  ## We can use listFilters() from the biomaRt package to get valid filter
  ## names:
  mart <- useEnsembl(biomart="ENSEMBL_MART_ENSEMBL",
                     dataset="hsapiens_gene_ensembl",
                     host="https://www.ensembl.org")
  head(listFilters(mart))

  ## Retrieve transcript dataset for Ensembl gene ENSG00000011198:
  my_filter <- list(ensembl_gene_id="ENSG00000011198")

  if (interactive()) {
    txdb4 <- makeTxDbFromBiomart(dataset="hsapiens_gene_ensembl",
                                 filter=my_filter)
    txdb4
    transcripts(txdb4, columns=c("tx_id", "tx_name", "gene_id"))
    transcriptLengths(txdb4)
  }

  ## ---------------------------------------------------------------------
  ## E. RETRIEVING CHROMOSOME INFORMATION ONLY
  ## ---------------------------------------------------------------------

  chrominfo <- getChromInfoFromBiomart(dataset="celegans_gene_ensembl")
  chrominfo
```

---

makeTxDbFromEnsembl   *Make a TxDb object from an Ensembl database*

Description

The makeTxDbFromEnsembl function creates a [TxDb](#) object for a given organism by importing the genomic locations of its transcripts, exons, CDS, and genes from an Ensembl database.

Note that it uses the **RMariaDB** package internally so make sure that this package is installed.

Usage

```
makeTxDbFromEnsembl(organism="Homo sapiens",
                    release=NA,
                    circ_seqs=NULL,
                    server="ensembldb.ensembl.org",
```

```
                              username="anonymous", password=NULL, port=0L,
                              tx_attrib=NULL,
                              taxonomyId=NA)
```

Arguments

organism   The *scientific name* (i.e. genus and species, or genus and species and subspecies)
                of the organism for which to import the data. Case is not sensitive. Underscores
                can be used instead of white spaces e.g. "homo_sapiens" is accepted.

release   The Ensembl release to query e.g. 89. If set to NA (the default), the current
                release is used.

circ_seqs   A character vector to list out which chromosomes should be marked as circular.

server   The name of the MySQL server to query. See https://www.ensembl.org/
                info/data/mysql.html for the list of Ensembl public MySQL servers. Make
                sure to use the server nearest to you. It can make a big difference!

username   Login username for the MySQL server.

password   Login password for the MySQL server.

port   Port of the MySQL server.

tx_attrib   If not NULL, only select transcripts with an attribute of the given code, a string,
                like "gencode_basic".

taxonomyId   By default this argument is set to NA and the taxonomy ID for the supplied
                organism will be automatically obtained and stored in the returned TxDb object.
                However, you can override this by supplying your own (valid) taxonomy ID,
                even though you should never need to do this.

Value

A TxDb object.

Note

makeTxDbFromEnsembl tends to be faster and more reliable than makeTxDbFromBiomart.

Author(s)

H. Pagès

See Also

- makeTxDbFromUCSC and makeTxDbFromBiomart for making a TxDb object from other online
  resources.
- makeTxDbFromGRanges and makeTxDbFromGFF for making a TxDb object from a GRanges
  object, or from a GFF or GTF file.
- TxDb objects implemented in the **GenomicFeatures** package.
- makeTxDb for the low-level function used by the makeTxDbFrom* functions to make the TxDb
  object returned to the user.

Examples

```
## Note that, right after a new Ensembl release, it can take up to 24 or
## 48 hours for the MySQL server at useastdb.ensembl.org to get updated
## with the new release. During that period, the server will be out-of-sync
## with the content at https://ftp.ensembl.org/pub/current_mysql/, which
## can cause makeTxDbFromEnsembl() to fail with an error like:
##   Error: Failed to connect: Unknown database 'some_organism_core_114_4'
## To avoid running into this issue in the context of this example, we
## first try useastdb.ensembl.org, and, if it fails, we fall back to
## ensembldb.ensembl.org.
txdb <- try(makeTxDbFromEnsembl("Saccharomyces cerevisiae",
                                server="useastdb.ensembl.org"))
if (inherits(txdb, "try-error")) {
    txdb <- try(makeTxDbFromEnsembl("Saccharomyces cerevisiae",
                                    server="ensembldb.ensembl.org"))
}
txdb
```

---

makeTxDbFromGFF	*Make a TxDb object from annotations available as a GFF3 or GTF file*

Description

The makeTxDbFromGFF function allows the user to make a [TxDb](#) object from transcript annotations available as a GFF3 or GTF file.

Usage

```
makeTxDbFromGFF(file,
                format=c("auto", "gff3", "gtf"),
                dataSource=NA,
                organism=NA,
                taxonomyId=NA,
                circ_seqs=NULL,
                chrominfo=NULL,
                metadata=NULL,
                dbxrefTag)
```

Arguments

file	Input GFF3 or GTF file. Can be a path to a file, or an URL, or a connection object, or a [GFF3File](#) or [GTFFile](#) object.
format	Format of the input file. Accepted values are: "auto" (the default) for auto-detection of the format, "gff3", or "gtf". Use "gff3" or "gtf" only if auto-detection failed.
dataSource	A single string describing the origin of the data file. Please be as specific as possible.

organism   What is the Genus and species of this organism. Please use proper scientific
                  nomenclature for example: "Homo sapiens" or "Canis familiaris" and not "hu-
                  man" or "my fuzzy buddy". If properly written, this information may be used
                  by the software to help you out later.

taxonomyId   By default this value is NA and the organism provided will be used to look up
                  the correct value for this. But you can use this argument to override that and
                  supply your own taxonomy id here (which will be separately validated). Since
                  providing a valid taxonomy id will not require us to look up one based on your
                  organism: this is one way that you can loosen the restrictions about what is and
                  isn't a valid value for the organism.

circ_seqs   A character vector to list out which chromosomes should be marked as circular.

chrominfo   Data frame containing information about the chromosomes. Will be passed to
                  the internal call to makeTxDb. See ?makeTxDb for more information. Alterna-
                  tively, can be a Seqinfo object.

metadata   A 2-column data frame containing meta information to be included in the TxDb
                  object. See ?makeTxDb for more information about the format of metadata.

dbxrefTag   If not missing, the values in the Dbxref attribute with the specified tag (like
                  "GeneID") are used for the feature names.

Details

makeTxDbFromGFF is a convenience function that feeds data from the parsed file to the makeTxDbFromGRanges
function.

Value

A TxDb object.

Author(s)

H. Pagès and M. Carlson

See Also

- makeTxDbFromGRanges, which makeTxDbFromGFF is based on, for making a TxDb object
  from a GRanges object.

- The import function in the **rtracklayer** package (also used by makeTxDbFromGFF internally).

- makeTxDbFromUCSC, makeTxDbFromBiomart, and makeTxDbFromEnsembl, for making a TxDb
  object from online resources.

- TxDb objects implemented in the **GenomicFeatures** package.

- makeTxDb for the low-level function used by the makeTxDbFrom* functions to make the TxDb
  object returned to the user.

Examples

```
## TESTING GFF3
gffFile <- system.file("extdata", "GFF3_files", "a.gff3", package="txdbmaker")
txdb <- makeTxDbFromGFF(gffFile,
                        dataSource="partial gtf file for Tomatoes for testing",
                        organism="Solanum lycopersicum")

## TESTING GTF, this time specifying some metadata and the chrominfo
gtfFile <- system.file("extdata", "GTF_files",
                       "GCA_002204515.1_AaegL5.0_genomic.gtf.gz",
                       package="txdbmaker")
resource_url <- paste0("ftp.ncbi.nlm.nih.gov/genomes/all/GCA/002/204/515/",
                       "GCA_002204515.1_AaegL5.0/")
metadata <- data.frame(name="Resource URL", value=resource_url)
chrominfo <- data.frame(chrom="MF194022.1",
                        length=16790,
                        is_circular=TRUE,
                        genome="AaegL5.0")
txdb2 <- makeTxDbFromGFF(gtfFile,
                         dataSource="NCBI",
                         organism="Aedes aegypti",
                         chrominfo=chrominfo,
                         metadata=metadata)
```

---

makeTxDbFromGRanges   *Make a TxDb object from a GRanges object*

Description

The makeTxDbFromGRanges function allows the user to extract gene, transcript, exon, and CDS information from a [GRanges](#) object structured as GFF3 or GTF, and to return that information in a [TxDb](#) object.

Usage

```
makeTxDbFromGRanges(gr, drop.stop.codons=FALSE, metadata=NULL, taxonomyId=NA)
```

Arguments

gr   A [GRanges](#) object structured as GFF3 or GTF, typically obtained with BiocIO::[import](#)().

drop.stop.codons

                TRUE or FALSE. If TRUE, then features of type stop_codon are ignored. Otherwise (the default) the stop codons are considered to be part of the CDS and merged to them.

metadata   A 2-column data frame containing meta information to be included in the [TxDb](#) object. This data frame is just passed to [makeTxDb](#), which makeTxDbFromGRanges calls at the end to make the [TxDb](#) object from the information extracted from gr. See ?[makeTxDb](#) for more information about the format of metadata.

taxonomyId   By default this value is NA which will result in an NA field since there is no
                    reliable way to infer this from a GRanges object. But you can use this argument
                    to supply your own valid taxId here and if you do, then the Organism can be
                    filled in as well

Value

A [TxDb](#) object.

Author(s)

Hervé Pagès

See Also

- [makeTxDbFromUCSC](#), [makeTxDbFromBiomart](#), and [makeTxDbFromEnsembl](#), for making a [TxDb](#)
  object from online resources.

- [makeTxDbFromGFF](#) for making a [TxDb](#) object from a GFF or GTF file.

- The [import](#) generic function in the **BiocIO** package.

- The asGFF method for [TxDb](#) objects ([asGFF,TxDb-method](#)) for the reverse of makeTxDbFromGRanges,
  that is, for turning a [TxDb](#) object into a [GRanges](#) object structured as GFF.

- [TxDb](#) objects implemented in the **GenomicFeatures** package.

- [makeTxDb](#) for the low-level function used by the makeTxDbFrom* functions to make the [TxDb](#)
  object returned to the user.

Examples

```
library(BiocIO)  # for the import() function

## ---------------------------------------------------------------------
## WITH A GRanges OBJECT STRUCTURED AS GFF3
## ---------------------------------------------------------------------
GFF3_files <- system.file("extdata", "GFF3_files", package="txdbmaker")

path <- file.path(GFF3_files, "a.gff3")
gr <- import(path)
txdb <- makeTxDbFromGRanges(gr)
txdb

## Reverse operation:
gr2 <- asGFF(txdb)

## Sanity check (asGFF() does not propagate the CDS phase at the moment):
target <- as.list(txdb)
target$splicings$cds_phase <- NULL
stopifnot(identical(target, as.list(makeTxDbFromGRanges(gr2))))

## ---------------------------------------------------------------------
## WITH A GRanges OBJECT STRUCTURED AS GTF
## ---------------------------------------------------------------------
```

```
GTF_files <- system.file("extdata", "GTF_files", package="txdbmaker")

## test1.gtf was grabbed from http://mblab.wustl.edu/GTF22.html (5 exon
## gene with 3 translated exons):
path <- file.path(GTF_files, "test1.gtf")
gr <- import(path)
txdb <- makeTxDbFromGRanges(gr)
txdb

path <- file.path(GTF_files, "GCA_002204515.1_AaegL5.0_genomic.gtf.gz")
gr <- import(path)
txdb <- makeTxDbFromGRanges(gr)
txdb
```

---

makeTxDbFromUCSC *Make a TxDb object from annotations available at the UCSC Genome Browser*

Description

The makeTxDbFromUCSC function allows the user to make a [TxDb](#) object from transcript annotations available at the UCSC Genome Browser.

Note that it uses the **RMariaDB** package internally so make sure that this package is installed.

Usage

```
makeTxDbFromUCSC(genome="hg19", tablename="knownGene",
        transcript_ids=NULL,
        circ_seqs=NULL,
        goldenPath.url=getOption("UCSC.goldenPath.url"),
        taxonomyId=NA)

supportedUCSCtables(genome="hg19")

browseUCSCtrack(genome="hg19", tablename="knownGene",
                url="https://genome.ucsc.edu/cgi-bin/")
```

Arguments

genome	The name of a UCSC genome assembly e.g. "hg19" or "panTro6". Get the list of UCSC genomes currently available with [list_UCSC_genomes](#)()[, "genome"].
tablename	The name of the UCSC table containing the transcript genomic locations to retrieve. Use the supportedUCSCtables utility function to get the list of tables known to work with makeTxDbFromUCSC.
transcript_ids	Optionally, only retrieve transcript locations for the specified set of transcript ids. If this is used, then the meta information displayed for the resulting [TxDb](#) object will say 'Full dataset: no'. Otherwise it will say 'Full dataset: yes'.

circ_seqs   Like [GRanges](#) objects, [SummarizedExperiment](#) objects, and many other objects
                 in Bioconductor, the [TxDb](#) object returned by makeTxDbFromUCSC contains a
                 [seqinfo](#) component that can be accessed with [seqinfo](#)(). This component con-
                 tains various sequence-level information like the sequence names, lengths, and
                 circularity flag for the genome assembly of the [TxDb](#) object.

                 As far as we know the information of which sequences are circular is not avail-
                 able in the UCSC Genome Browser. However, for the most commonly used
                 UCSC genome assemblies makeTxDbFromUCSC will get this information from a
                 knowledge database stored in the **GenomeInfoDb** package (see ?[registered_UCSC_genomes](#)).

                 For less commonly used UCSC genome assemblies, makeTxDbFromUCSC will
                 make a guess based on the chromosome names (e.g. chrM or 2micron will be
                 assumed to be circular). Even though this works most of the time, it is not
                 guaranteed to work *all the time*. So in this case a warning is issued. If you think
                 the guess is incorrect then you can supply your own list of circular sequences
                 (as a character vector) via the circ_seqs argument.

goldenPath.url   A single string specifying the URL to the UCSC goldenPath location where the
                 chromosome sizes are expected to be found.

url   Use to specify the location of an alternate UCSC Genome Browser.

taxonomyId   By default this value is NA and the organism inferred will be used to look up the
                 correct value for this. But you can use this argument to supply your own valid
                 taxId here.

Details

makeTxDbFromUCSC is a convenience function that feeds data from the UCSC source to the lower
level [makeTxDb](#) function. See ?[makeTxDbFromEnsembl](#) for a similar function that feeds data from
an Ensembl database.

Value

For makeTxDbFromUCSC: A [TxDb](#) object.

For supportedUCSCtables: A data frame with 3 columns (tablename, track, and subtrack) and
1 row per table known to work with makeTxDbFromUCSC. IMPORTANT NOTE: In the returned data
frame, the set of tables associated with a track with subtracks might contain tables that don't exist
for the specified genome.

Author(s)

M. Carlson and H. Pagès

See Also

- [makeTxDbFromEnsembl](#) and [makeTxDbFromBiomart](#) for making a [TxDb](#) object from other
  online resources.
- [makeTxDbFromGRanges](#) and [makeTxDbFromGFF](#) for making a [TxDb](#) object from a [GRanges](#)
  object, or from a GFF or GTF file.
- [list_UCSC_genomes](#) in the **UCSC.utils** package to get the list of UCSC genomes.

- [TxDb](#) objects implemented in the **GenomicFeatures** package.
- [makeTxDb](#) for the low-level function used by the makeTxDbFrom* functions to make the [TxDb](#) object returned to the user.

Examples

```
## Use list_UCSC_genomes() to obtain the list of all UCSC genomes:
library(UCSC.utils)
list_UCSC_genomes()[ , "genome"]

## To search genomes for a particular organism:
list_UCSC_genomes("human")

## Display the list of tables known to work with makeTxDbFromUCSC():
supportedUCSCtables("hg38")
supportedUCSCtables("hg19")

## Open the UCSC track page for a given organism/table:
browseUCSCtrack("hg38", tablename="knownGene")
browseUCSCtrack("hg19", tablename="knownGene")

browseUCSCtrack("hg38", tablename="ncbiRefSeqSelect")
browseUCSCtrack("hg19", tablename="ncbiRefSeqSelect")

browseUCSCtrack("hg19", tablename="pseudoYale60")

browseUCSCtrack("sacCer3", tablename="ensGene")

## Retrieve a full transcript dataset for Yeast from UCSC:
txdb1 <- makeTxDbFromUCSC("sacCer3", tablename="ensGene")
txdb1

## Retrieve an incomplete transcript dataset for Mouse from UCSC (only
## transcripts linked to Entrez Gene ID 22290):
transcript_ids <- c(
    "uc009uzf.1",
    "uc009uzg.1",
    "uc009uzh.1",
    "uc009uzi.1",
    "uc009uzj.1"
)

txdb2 <- makeTxDbFromUCSC("mm10", tablename="knownGene",
                          transcript_ids=transcript_ids)
txdb2
```

---

makeTxDbPackage   *Making a TxDb package from annotations available at the UCSC Genome Browser, biomaRt or from another source.*

Description

A TxDb package is an annotation package containing a [TxDb](#) object.

The makeTxDbPackageFromUCSC function allows the user to make a [TxDb](#) package from transcript annotations available at the UCSC Genome Browser.

The makeTxDbPackageFromBiomart function allows the user to do the same thing as makeTxDbPackageFromUCSC except that the annotations originate from biomaRt.

Finally, the makeTxDbPackage function allows the user to make a [TxDb](#) package directly from a [TxDb](#) object.

Usage

```
makeTxDbPackageFromUCSC(
    version=,
    maintainer,
    author,
    destDir=".",
    license="Artistic-2.0",
    genome="hg19",
    tablename="knownGene",
    transcript_ids=NULL,
    circ_seqs=NULL,
    goldenPath.url=getOption("UCSC.goldenPath.url"),
    taxonomyId=NA)

makeFDbPackageFromUCSC(
    version,
    maintainer,
    author,
    destDir=".",
    license="Artistic-2.0",
    genome="hg19",
    track="tRNAs",
    tablename="tRNAs",
    columns = UCSCFeatureDbTableSchema(genome, track, tablename),
    url="https://genome.ucsc.edu/cgi-bin/",
    goldenPath.url=getOption("UCSC.goldenPath.url"),
    chromCol=NULL,
    chromStartCol=NULL,
    chromEndCol=NULL,
    taxonomyId=NA)

makeTxDbPackageFromBiomart(
    version,
    maintainer,
    author,
    destDir=".",
    license="Artistic-2.0",
```

```
                      biomart="ENSEMBL_MART_ENSEMBL",
                      dataset="hsapiens_gene_ensembl",
                      transcript_ids=NULL,
                      circ_seqs=NULL,
                      filter=NULL,
                      id_prefix="ensembl_",
                      host="https://www.ensembl.org",
                      taxonomyId=NA)

           makeTxDbPackage(txdb,
                           version,
                           maintainer,
                           author,
                           destDir=".",
                           license="Artistic-2.0",
                           pkgname=NULL,
                           provider=NULL,
                           providerVersion=NULL)

           makePackageName(txdb)
```

Arguments

version	What is the version number for this package?
maintainer	Who is the package maintainer? (must include email to be valid). Should be a [person](#) object, or something coercible to one, like a string. May be omitted if the author argument is a person containing someone with the maintainer role.
author	Who is the creator of this package? Should be a [person](#) object, or something coercible to one, like a character vector of names. The maintainer argument will be merged into this list.
destDir	A path where the package source should be assembled.
license	What is the license (and it's version)
biomart	which BioMart database to use. Get the list of all available BioMart databases with the [listMarts](#) function from the biomaRt package. See the details section below for a list of BioMart databases with compatible transcript annotations.
dataset	which dataset from BioMart. For example: "hsapiens_gene_ensembl", "mmusculus_gene_ensembl", "dmelanogaster_gene_ensembl", "celegans_gene_ensembl", etc in the ensembl database. See the examples section below for how to discover which datasets are available in a given BioMart database.
genome	name of a UCSC genome assembly e.g. "hg19" or "panTro6". Get the list of UCSC genomes currently available with [list_UCSC_genomes](#)()[, "genome"].
track	name of the UCSC track. Use [list_UCSC_tracks](#) from the **UCSC.utils** package to get the list of available tracks and associated primary tables for a particular genome.
tablename	name of the UCSC table containing the transcript annotations to retrieve. Use the [supportedUCSCtables](#) utility function to get the list of tables known to work with makeTxDbFromUCSC.

transcript_ids	optionally, only retrieve transcript annotation data for the specified set of transcript ids. If this is used, then the meta information displayed for the resulting TxDb object will say 'Full dataset: no'. Otherwise it will say 'Full dataset: yes'.
circ_seqs	a character vector to list out which chromosomes should be marked as circular.
filter	Additional filters to use in the BioMart query. Must be a named list. An example is filter=as.list(c(source="entrez"))
host	The host URL of the BioMart. Defaults to https://www.ensembl.org.
id_prefix	Specifies the prefix used in BioMart attributes. For example, some BioMarts may have an attribute specified as "ensembl_transcript_id" whereas others have the same attribute specified as "transcript_id". Defaults to "ensembl_".
columns	a named character vector to list out the names and types of the other columns that the downloaded track should have. Use UCSCFeatureDbTableSchema to retrieve this information for a particular table.
url, goldenPath.url	
	use to specify the location of an alternate UCSC Genome Browser.
chromCol	If the schema comes back and the 'chrom' column has been labeled something other than 'chrom', use this argument to indicate what that column has been labeled as so we can properly designate it. This could happen (for example) with the knownGene track tables, which has no 'chromStart' or 'chromEnd' columns, but which DOES have columns that could reasonably substitute for these columns under particular circumstances. Therefore we allow these three columns to have arguments so that their definition can be re-specified
chromStartCol	Same thing as chromCol, but for renames of 'chromStart'
chromEndCol	Same thing as chromCol, but for renames of 'chromEnd'
txdb	A TxDb object that represents a handle to a transcript database. This object type is what is returned by makeTxDbFromUCSC, makeTxDbFromUCSC or makeTxDb
taxonomyId	By default this value is NA and the organism provided (or inferred) will be used to look up the correct value for this. But you can use this argument to override that and supply your own valid taxId here
pkgname	By default this value is NULL and does not need to be filled in (a package name will be generated for you). But if you override this value, then the package and it's object will be instead named after this value. Be aware that the standard rules for package names will apply, (so don't include spaces, underscores or dashes)
provider	If not given, a default is taken from the 'Data source' field of the metadata table.
providerVersion	
	If not given, a default is taken from one of 'UCSC table', 'BioMart version' or 'Data source' fields of the metadata table.

Details

makeTxDbPackageFromUCSC is a convenience function that calls both the makeTxDbFromUCSC and the makeTxDbPackage functions. The makeTxDbPackageFromBiomart follows a similar pattern and calls the makeTxDbFromBiomart and makeTxDbPackage functions.

Value

A [TxDb](#) object.

Author(s)

M. Carlson

Examples

```
## First consider relevant helper/discovery functions:
## Get the list of tables known to work with makeTxDbPackageFromUCSC():
supportedUCSCtables(genome="hg19")

## Next are examples of actually building a package:

## Makes a transcript package for Yeast from the ensGene table at UCSC:
makeTxDbPackageFromUCSC(version="0.01",
                        maintainer="Some One <so@someplace.org>",
                        author="Some One <so@someplace.com>",
                        genome="sacCer2",
                        tablename="ensGene")

## Makes a transcript package from Human by using biomaRt and limited to a
## small subset of the transcripts.
transcript_ids <- c(
    "ENST00000400839",
    "ENST00000400840",
    "ENST00000478783",
    "ENST00000435657",
    "ENST00000268655",
    "ENST00000313243",
    "ENST00000341724")

makeTxDbPackageFromBiomart(version="0.01",
                           maintainer="Some One <so@someplace.org>",
                           author="Some One <so@someplace.com>",
                           transcript_ids=transcript_ids)
```
