

In-silico cleavage of polypeptides using the `cleaver` package

Sebastian Gibb*

October 17, 2016

Contents

1 Introduction

Most proteomics experiments need protein (peptide) separation and cleavage procedures before these molecules could be analyzed or identified by mass spectrometry or other analytical tools.

`cleaver` allows in-silico cleavage of polypeptide sequences to e.g. create theoretical mass spectrometry data.

The cleavage rules are taken from the [ExPASy PeptideCutter tool](#)[?].

2 Simple Usage

Loading the `cleaver` package:

```
> library("cleaver")
```

Getting help and list all available cleavage rules:

```
> help("cleave")
```

Cleaving of *Gastric juice peptide 1 (P01358)* using *Trypsin*:

```
> ## cleave it
> cleave("LAAGKVEDSD", enzym="trypsin")
$LAAGKVEDSD
[1] "LAAGK" "VEDSD"
> ## get the cleavage ranges
> cleavageRanges("LAAGKVEDSD", enzym="trypsin")
```

*mail@sebastiangibb.de

```
$LAAGKVEDSD
      start end
[1,]      1   5
[2,]      6  10

> ## get only cleavage sites
> cleavageSites("LAAGKVEDSD", enzym="trypsin")

$LAAGKVEDSD
[1] 5
```

Sometimes cleavage is not perfect and the enzym miss some cleavage positions:

```
> ## miss one cleavage position
> cleave("LAAGKVEDSD", enzym="trypsin", missedCleavages=1)

$LAAGKVEDSD
[1] "LAAGKVEDSD"

> cleavageRanges("LAAGKVEDSD", enzym="trypsin", missedCleavages=1)

$LAAGKVEDSD
      start end
[1,]      1   10

> ## miss zero or one cleavage positions
> cleave("LAAGKVEDSD", enzym="trypsin", missedCleavages=0:1)

$LAAGKVEDSD
[1] "LAAGK"       "VEDSD"       "LAAGKVEDSD"

> cleavageRanges("LAAGKVEDSD", enzym="trypsin", missedCleavages=0:1)

$LAAGKVEDSD
      start end
[1,]      1   5
[2,]      6  10
[3,]      1  10
```

Combine *cleaver* and the *Biostrings* R package⁷:

```
> ## create AAStringSet object
> p <- AAStringSet(c(gaju="LAAGKVEDSD", pnm="AGEPKLDAGV"))
>
> ## cleave it
> cleave(p, enzym="trypsin")

AAStringSetList of length 2
[[["gaju"]]] LAAGK VEDSD
[[["pnm"]]] AGEPK LDAGV

> cleavageRanges(p, enzym="trypsin")

IRangesList of length 2
$gaju
```

```
IRanges object with 2 ranges and 0 metadata columns:
      start     end     width
      <integer> <integer> <integer>
[1]       1       5       5
[2]       6      10       5

$pnm
IRanges object with 2 ranges and 0 metadata columns:
      start     end     width
      <integer> <integer> <integer>
[1]       1       5       5
[2]       6      10       5

> cleavageSites(p, enzym="trypsin")

$gaju
[1] 5

$pnm
[1] 5
```

3 Insulin & Somatostatin Example

Downloading *Insulin* (*P01308*) and *Somatostatin* (*P61278*) sequences from the [UniProt](#)⁷ database using the [UniProt.ws](#) R package⁷.

```
> ## load UniProt.ws library
> library("UniProt.ws")
>
> ## select species Homo sapiens
> UniProt.ws <- UniProt.ws(taxId=9606)
>
> ## download sequences of Insulin/Somatostatin
> s <- select(UniProt.ws, keys=c("P01308", "P61278"), columns=c("SEQUENCE"))
```

Getting extra data for P01308, P61278

'select()' returned 1:1 mapping between keys and columns

```
> ## fetch only sequences
> sequences <- setNames(s$SEQUENCE, s$UNIPROTKB)
>
> ## remove whitespaces
> sequences <- gsub(pattern="[:space:]", replacement="", x=sequences)
```

Cleaving using Pepsin:

```
> cleave(sequences, enzym="pepsin")
$P01308
```

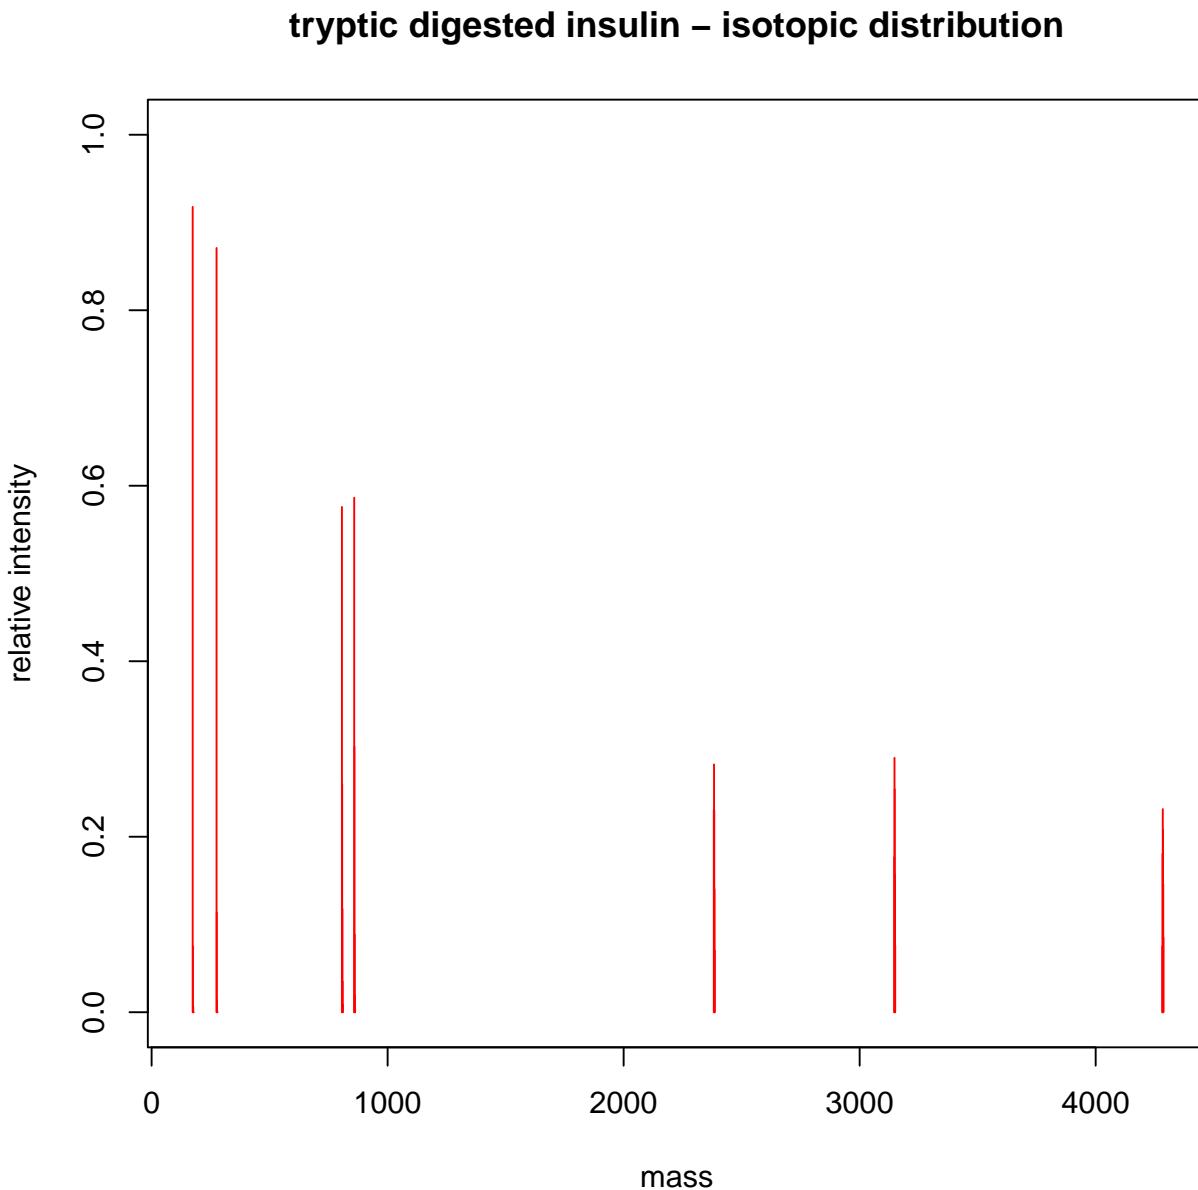

```
[1] "MA"           "L"           "WMRLLP"        "LL"
[5] "A"            "WGPDPAAA"      "F"            "VNQH"
[9] "CGSH"         "VEA"          "Y"             "VCGERG"
[13] "FF"           "YTPKTRREAED"   "QVGQVE"       "GGGPGAGS"
[17] "LQP"          "LA"           "EGS"          "QKRGIVEQCCTSICS"
[21] "YQ"           "ENYCN"         ""              ""

$P61278
[1] "ML"           "SCRL"         "QCA"
[4] "L"            "AA"           "SIV"
[7] "A"            "GCVTGAPSDPRL"  "RQ"
[10] "FL"          "QKS"          "LAAAAGKQEL"
[13] "AKY"          "AE"           "SEPNQTENDA"
[16] "LEPED"        "SQAAEQDEMRL"   "EL"
[19] "QRSANSNPAMAPRERKAGCKN" "FF"           "WKT"
[22] "FTSC"         ""              ""
```

4 Isotopic Distribution Of Tryptic Digested Insulin

A common use case of in-silico cleavage is the calculation of the isotopic distribution of peptides (which were enzymatic digested in the in-vitro experimental workflow). Here the *BRAIN* R package^{??} is used to calculate the isotopic distribution of *cleaver*'s output. (please note: it is only a toy example, e.g. the relation of intensity values between peptides isn't correct).

```
> ## load BRAIN library
> library("BRAIN")
>
> ## cleave insulin
> cleavedInsulin <- cleave(sequences[1], enzym="trypsin")[[1]]
>
> ## create empty plot area
> plot(NA, xlim=c(150, 4300), ylim=c(0, 1),
+       xlab="mass", ylab="relative intensity",
+       main="tryptic digested insulin - isotopic distribution")
>
> ## loop through peptides
> for (i in seq(along=cleavedInsulin)) {
+   ## count C, H, N, O, S atoms in current peptide
+   atoms <- BRAIN::getAtomsFromSeq(cleavedInsulin[[i]])
+   ## calculate isotopic distribution
+   d <- useBRAIN(atoms)
+   ## draw peaks
+   lines(d$masses, d$isoDistr, type="h", col=2)
+ }
```

5 Session Information

- R version 3.3.1 (2016-06-21), x86_64-apple-darwin13.4.0
- Locale: C/en_US.UTF-8/en_US.UTF-8/C/en_US.UTF-8/en_US.UTF-8
- Base packages: base, datasets, grDevices, graphics, methods, parallel, stats, stats4, utils
- Other packages: BRAIN 1.20.0, BiocGenerics 0.20.0, Biostrings 2.42.0, DBI 0.5-1, IRanges 2.8.0, PolynomF 0.94, RCurl 1.95-4.8, RSQLite 1.0.0, S4Vectors 0.12.0, UniProt.ws 2.14.0, XVector 0.14.0, bitops 1.0-6, cleaver 1.12.0, knitr 1.14, lattice 0.20-34
