Abstract

The **MIGSA** package allows to perform a massive and integrative gene set analysis over several experiments and gene sets simultaneously. It provides a common gene expression analytic framework that grants a comprehensive and coherent analysis. Only a minimal user parameter setting is required to perform both singular and gene set enrichment analyses in an integrative manner by means of enhanced versions of the best available methods, i.e. **dEnricher** and **mGSZ** respectively.

One of the greatest strengths of this big omics data tool is the availability of several functions to explore, analyze and visualize its results in order to facilitate the data mining task over huge information sources.

The MIGSA package also allows to easily load the most updated gene sets collections from several repositories.

Keywords: singular enrichment analysis, over representation analysis, gene set enrichment analysis, functional class scoring, big omics data, r package, bioconductor.

1. Introduction

The functional analysis methodology allows researchers to gain biological insight from a list of deregulated gene sets between experimental conditions of interest. As suggested by (Rodriguez *et al.* 2016) both singular enrichment analysis (SEA) and gene set enrichment analysis (GSEA) must be performed over the same dataset in order to gain as much biological insight as possible. This strategy is known as Integrative Functional Analysis (IFA) and integrates into the same analysis with enhanced versions of the dEnricher (Fang and Gough 2014) and mGSZ (Mishra *et al.* 2014) methods.

At present, there are several freely available datasets which provide data over the same disease, characteristic of interest (e.g. survival), or subjects studied over several different platforms. The Cancer Genome Atlas (TCGA) among other projects makes possible the study and comparison in a massive way of these datasets, not only among them but, also against our own population of interest. This unprecedented opportunity allows researchers to search for

common functional patterns between these studies, or, more interestingly, particular patterns of our experiment in question. However, this type of approach has not been implemented in any existing tool yet, leaving aside valuable biological information that might assist research hypotheses.

Here, we present a Massive and Integrative Gene Set Analysis tool called **MIGSA**. It allows to evaluate and compare, massively and transparently, a large collection of datasets coming from diverse sources, maintaining the gene set enrichment ideas of IFA and minimizing parameter settings. In addition, it includes a gene ranking score alternative for RNAseq data by integrating the *Voom+Limma* methodological approach. It provides an enhanced version of mGSZ (**MIGSAmGSZ**) faster than the default implementation, in order to speed up even more its execution, **MIGSA** can be run using multicore architectures. In this sense it can be applied over a large collection of datasets on many gene sets in a fast way. Finally, **MIGSA** provides several user-friendly methods to easily explore and visualize results at gene set, dataset and individual gene level to aid researchers in their biological hypothesis understanding.

2. Preliminaries

2.1. Citing MIGSA

MIGSA implements a body of methodological research by the authors and co-workers. Citations are the main means by which the authors receive professional credit for their work. The **MIGSA** package can be cited as:

Rodriguez JC, González GA, Fresno C, Llera AS, Fernández EA (2016).
“Improving information retrieval in functional analysis.” *Computers in Biology and Medicine*, **79**, 10–20.

2.2. Installation

MIGSA is a package for the R computing environment and it is assumed that you have already installed R. See the R project at <http://www.r-project.org>. To install the latest version of **MIGSA**, you will need to be using the latest version of R.

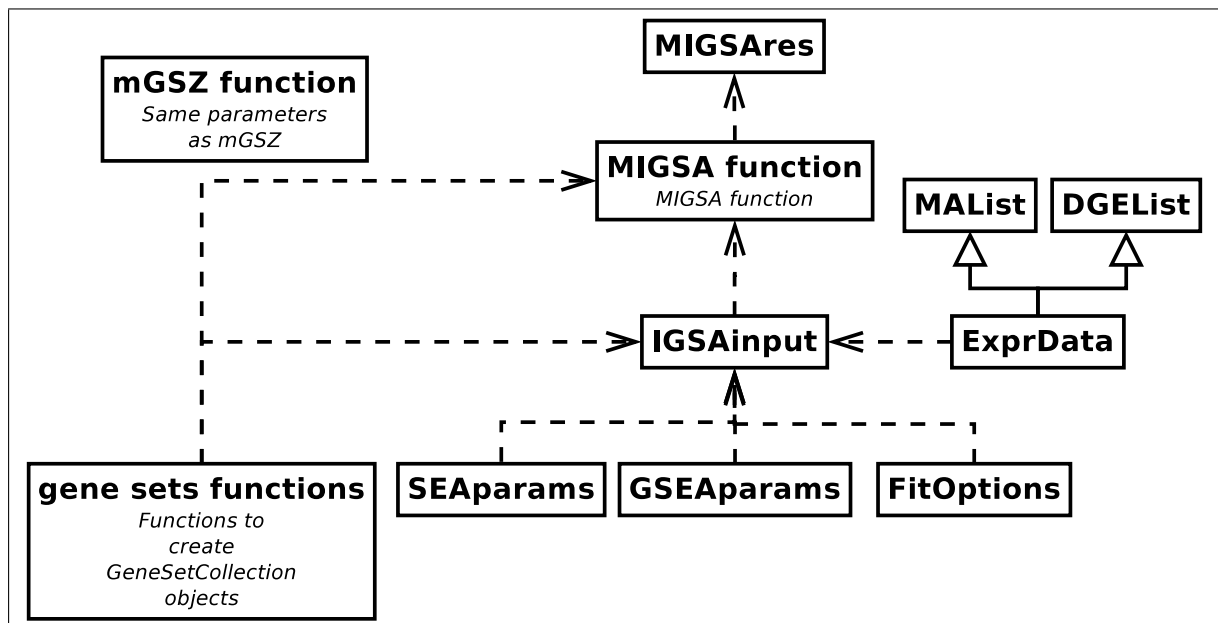

MIGSA is part of the Bioconductor project at <http://www.bioconductor.org>. (Prior to R 3.4).

To get **MIGSA** package you can type in an R session:

```
> ## try http:// if https:// URLs are not supported
> if (!requireNamespace("BiocManager", quietly=TRUE))
+   install.packages("BiocManager");
> BiocManager::install("MIGSA");
```

2.3. Class definitions

MIGSA basically consists of six classes and various functions that interact with them. The following is a simplified class diagram of **MIGSA**.

Following we present a detailed diagram of each class, including the functions that interact in each case. It should be noted that these diagrams represent a general overview of MIGSA, for a detailed explanation of each class and function please refer to the user manual.

3. Gene sets

MIGSA allows to perform the functional analysis of any type of gene sets provided by the user. Such gene sets should be present as **GeneSetCollection** objects from the **GSEABase** R library, in this section we will give a brief introduction on how to construct such an object from our own gene sets. In addition, the tools provided by **MIGSA** to automatically load various collections of known gene sets will be presented.

3.1. Sample GeneSetCollection creation

Here we present a simple way to create a **GeneSetCollection** object from own gene sets, for more detailed information please refer to the **GSEABase** documentation.

For this example we are going to manually create the **GeneSetCollection** object for the gene sets hsa00232, hsa00130 and hsa00785 from KEGG.

First, we will have to create each gene set separately, and then the **GeneSetCollection** object.

```
> library(GSEABase);
```

```

> gs1 <- GeneSet(c("10", "1544", "1548", "1549", "1553", "7498", "9"),
+   setName="hsa00232",
+   setIdentifier="Caffeine metabolism");
> gs1;

setName: hsa00232
geneIds: 10, 1544, ..., 9 (total: 7)
geneIdType: Null
collectionType: Null
details: use 'details(object)'

> gs2 <- GeneSet(c("10229", "27235", "3242", "51004", "51805", "6898", "84274"),
+   setName="hsa00130",
+   setIdentifier="Ubiquinone and other terpenoid-quinone biosynthesis");
> gs3 <- GeneSet(c("11019", "387787", "51601"),
+   setName="hsa00785",
+   setIdentifier="Lipoic acid metabolism");
> ## And now construct the GeneSetCollection object.
> gsetsColl <- GeneSetCollection(list(gs1, gs2, gs3));
> gsetsColl;

GeneSetCollection
  names: hsa00232, hsa00130, hsa00785 (3 total)
  unique identifiers: 10, 1544, ..., 51601 (17 total)
  types in collection:
    geneIdType: NullIdentifier (1 total)
    collectionType: NullCollection (1 total)

```

3.2. MIGSA gene sets loading

As mentioned above, **MIGSA** provides functions for automatically loading known collections of gene sets. These functions are `loadGo` and `downloadEnrichrGeneSets`, the first constructs the `GeneSetCollection` object using the **org.Hs.eg.db** R package. Meanwhile, `downloadEnrichrGeneSets` constructs the object by downloading the gene sets from the Enrichr database (<http://amp.pharm.mssm.edu/Enrichr/#stats>). Enrichr gene set names can be listed with the `enrichrGeneSets` function.

```

> ## Not run:
>
> ## Load cellular component gene sets (another possibility would be "MF" or "BP")
> ccGsets <- loadGo("CC"); # It is a GeneSetCollection object
> ## Load KEGG and Reactome gene sets
> keggReact <- downloadEnrichrGeneSets(c("KEGG_2015", "Reactome_2015"));
> ## It is a list object containing two GeneSetCollection objects
>
> ## End(Not run)

```

4. MIGSAmGSZ

4.1. mGSZ speedup

As stated below, **MIGSA** provides the MIGSAmGSZ function, which implements *mGSZ* but running much faster. In order to test MIGSAmGSZ's correctness and speed up over *mGSZ*, it was evaluated using the TCGA's microarray breast cancer dataset. Basal vs. Luminal A contrast was tested (16,207 genes x 237 subjects) over the Gene Ontology and KEGG gene sets (20,425 gene sets).

This analysis was carried out using an Intel(R) Xeon(R) E5-2620 v3 @ 2.40GHz (24 cores), 128 GB RAM. Different number of cores were used to analyze the speed up.

Let's test it!

Note that we are using MulticoreParam as I am testing under Linux.

```
> library(BiocParallel);
> library(mGSZ);
> library(MIGSA);
> library(MIGSAdata);
> data(tcgaMAdata);
> subtypes <- tcgaMAdata$subtypes;
> geneExpr <- tcgaMAdata$geneExpr;
> ## MA data: filter genes with less than 30% of genes read per condition
> dim(geneExpr);
```

```
[1] 16207    237
```

```
> geneExpr <- geneExpr[
+   rowSums(is.na(geneExpr[, subtypes == "Basal" ])) <
+   .3*sum(subtypes == "Basal") &
+   rowSums(is.na(geneExpr[, subtypes == "LumA" ])) <
+   .3*sum(subtypes == "LumA")
+   , ];
> dim(geneExpr);
```

```
[1] 16207    237
```

```
> ## Not run:
>
> ## Download GO and KEGG gene sets using MIGSA
> gSets <- list(
+   KEGG=downloadEnrichrGeneSets("KEGG_2015")[[1]],
+   BP=loadGo("BP"),
+   CC=loadGo("CC"),
+   MF=loadGo("MF"));
> gSetsList <- do.call(c, lapply(gSets, MIGSA:::asList));
> rm(gSets);
```

```

> nCores <- c(1,2,4,8,10,12,14);
> allRes <- lapply(nCores, function(actCores) {
+   # setting in how many cores to run
+   bp_param <- MulticoreParam(workers=actCores, threshold="DEBUG",
+     progressbar=TRUE);
+
+   set.seed(8818);
+   newtimeSpent <- Sys.time();
+   MIGSAmGSZres <- MIGSAmGSZ(geneExpr, gSetsList, subtypes,
+     bp.param=bp_param);
+   newtimeSpent <- Sys.time()-newtimeSpent;
+
+   res <- list(timeSpent=newtimeSpent, res=MIGSAmGSZres);
+
+   return(res);
+ })
> set.seed(8818);
> timeSpent <- Sys.time();
> mGSZres <- mGSZ(geneExpr, gSetsList, subtypes);
> timeSpent <- Sys.time()-timeSpent;
> mGSZres <- mGSZres$mGSZ;
> ## this tests that the returned values are equal, must give all TRUE
> lapply(allRes, function(actRes) {
+   actRes <- actRes$res;
+   actRes <- actRes[,1:4];
+   mergedRes <- merge(mGSZres, actRes, by="gene.sets",
+     suffixes=c("mGSZ", "MIGSAmGSZ"));
+
+   all(unlist(lapply(2:4, function(x) {
+     all.equal(mergedRes[,x], mergedRes[,x+3])
+   })));
+ })
> ## End(Not run)

> ## As last chunk of code was not executed, we load that data:
> library(MIGSAdata);
> data(mGSZspeedup);
> nCores <- mGSZspeedup$nCores;
> allRes <- mGSZspeedup$allRes;
> timeSpent <- mGSZspeedup$timeSpent;
> ## End>Loading data)
>
> newtimeSpent <- lapply(allRes, function(actRes) {
+   actRes$timeSpent;
+ })
> names(newtimeSpent) <- nCores;
> speeduptable <- c(timeSpent, unlist(newtimeSpent));

```

```

> names(speeduptable) <- c(1, nCores);
> ## Let's put all times in the same unit in order to measure speedup
> newtimeSpent <- lapply(newtimeSpent, function(acttime) {
+   units(acttime) <- "secs";
+   return(acttime);
+ });
> units(timeSpent) <- "secs";
> speedup <- do.call(c, lapply(newtimeSpent, function(acttime)
+   as.numeric(timeSpent)/as.numeric(acttime)));
> speeduptable <- rbind(speeduptable, c(1, speedup));
> ## calculate efficiency
> speeduptable <- rbind(speeduptable,
+   speeduptable[2,] / as.numeric(colnames(speeduptable)));
> rownames(speeduptable) <- c("Runtime", "Speedup", "Efficiency");
> round(speeduptable, 2);

```

	1	1	2	4	8	10	12	14
Runtime	2.46	1.55	46.50	24.98	15.63	13.67	14.79	28.43
Speedup	1.00	1.58	3.18	5.91	9.45	10.81	9.98	5.19
Efficiency	1.00	1.58	1.59	1.48	1.18	1.08	0.83	0.37

As it can be seen in Table 1, no matter the number of cores in which MIGSAmGSZ was tested, it outperformed *mGSZ*. Running in one core, it has shown a speedup of 1.6X, reaching for a top of 10.8X speedup with ten cores, giving the same results in 14 minutes in contrast to *mGSZ*'s 2.46 hours execution.

Table 1: MIGSAmGSZ speedup

	mGSZ		MIGSAmGSZ					
#cores	1	1	2	4	8	10	12	14
Runtime	2.46h	1.55h	46.5m	24.98m	15.63m	13.67m	14.79m	28.43m
Speedup	1	1.58	3.18	5.91	9.45	10.81	9.98	5.19
Efficiency	1	1.58	1.59	1.48	1.18	1.08	0.83	0.37

4.2. MIGSAmGSZ simple example

Following, we show how to simply execute one MIGSAmGSZ analysis.

In this example we will generate an expression matrix with 200 genes (ten differentially expressed) and eight subjects (four of condition "C1" and four of "C2"), and 50 gene sets of ten genes each one.

```

> library(MIGSA);
> ## Let's create our gene expression matrix with 200 genes and 8 subjects
> nSamples <- 8; # 8 subjects
> nGenes <- 200; # 200 genes
> geneNames <- paste("g", 1:nGenes, sep = ""); # with names g1 ... g200
> ## Create random gene expression data matrix.

```

```

> set.seed(8818);
> exprMatrix <- matrix(rnorm(nGenes*nSamples),ncol=nSamples);
> ## It must have rownames, as they will be treated as the gene names!
> rownames(exprMatrix) <- geneNames;
> ## There will be 10 differentially expressed genes.
> nDeGenes <- 10;
> ## Let's generate the offsets to sum to the differentially expressed genes.
> deOffsets <- matrix(2*abs(rnorm(nDeGenes*nSamples/2)), ncol=nSamples/2);
> ## Randomly select which are the DE genes.
> deIndexes <- sample(1:nGenes, nDeGenes, replace=FALSE);
> exprMatrix[deIndexes, 1:(nSamples/2)] <-
+   exprMatrix[deIndexes, 1:(nSamples/2)] + deOffsets;
> ## 4 subjects with condition C1 and 4 with C2.
> conditions <- rep(c("C1", "C2"),c(nSamples/2,nSamples/2));
> nGSets <- 50; # 50 gene sets
> ## Let's create randomly 50 gene sets, of 10 genes each
> gSets <- lapply(1:nGSets, function(i) sample(geneNames, size=10));
> names(gSets) <- paste("set", as.character(1:nGSets), sep="");
> ## with names set1 ... set50
>
> ## And simply execute MIGSAmGSZ
> MIGSAmGSZres <- MIGSAmGSZ(exprMatrix, gSets, conditions);

5. MIGSA simple example

Following, we show how to simply execute one *MIGSA* analysis.

In this example we will generate two expression matrices with 300 genes (30 differentially expressed) and 16 subjects (8 of condition “C1” and 8 of “C2”), and two sets of 30 gene sets of ten genes each one.

```
> library(MIGSA);
> ## Let's simulate two expression matrices of 300 genes and 16 subjects.
> nGenes <- 300; # 300 genes
> nSamples <- 16; # 16 subjects
> geneNames <- paste("g", 1:nGenes, sep = ""); # with names g1 ... g300
> ## Create the random gene expression data matrices.
> set.seed(8818);
> exprData1 <- matrix(rnorm(nGenes*nSamples),ncol=nSamples);
> rownames(exprData1) <- geneNames;
> exprData2 <- matrix(rnorm(nGenes*nSamples),ncol=nSamples);
> rownames(exprData2) <- geneNames;
> ## There will be 30 differentially expressed genes.
> nDeGenes <- nGenes/10;
> ## Let's generate the offsets to sum to the differentially expressed genes.
> deOffsets <- matrix(2*abs(rnorm(nDeGenes*nSamples/2)), ncol=nSamples/2);
> ## Randomly select which are the DE genes.
> deIndexes1 <- sample(1:nGenes, nDeGenes, replace=FALSE);
> exprData1[deIndexes1, 1:(nSamples/2)] <-
+   exprData1[deIndexes1, 1:(nSamples/2)] + deOffsets;
> deIndexes2 <- sample(1:nGenes, nDeGenes, replace=FALSE);
> exprData2[deIndexes2, 1:(nSamples/2)] <-
+   exprData2[deIndexes2, 1:(nSamples/2)] + deOffsets;
> exprData1 <- new("MAlis",list(M=exprData1));
> exprData2 <- new("MAlis",list(M=exprData2));
> ## 8 subjects with condition C1 and 8 with C2.
> conditions <- rep(c("C1", "C2"),c(nSamples/2,nSamples/2));
> fitOpts <- FitOptions(conditions);
> nGSets <- 30; # 30 gene sets
> ## Let's create randomly 30 gene sets, of 10 genes each
>
> gSets1 <- lapply(1:nGSets, function(i) sample(geneNames, size=10));
> names(gSets1) <- paste("set", as.character(1:nGSets), sep="");
> myGSs1 <- as.Genesets(gSets1);
> gSets2 <- lapply(1:nGSets, function(i) sample(geneNames, size=10));
> names(gSets2) <- paste("set", as.character((nGSets+1):(2*nGSets)), sep="");
> myGSs2 <- as.Genesets(gSets2);
> igsaInput1 <- IGSAinput(name="igsaInput1", expr_data=exprData1,
+   fit_options=fitOpts);
> igsaInput2 <- IGSAinput(name="igsaInput2", expr_data=exprData2,
+   fit_options=fitOpts);
> experiments <- list(igsaInput1, igsaInput2);
> ## As we did not set gene sets for each IGSAinput, then we will have to
> ## provide them in MIGSA function
```

```

>
> ## another way of generating the same MIGSA input would be setting the
> ## gene sets individually to each IGSAinput:
> igsaInput1 <- IGSAinput(name="igsaInput1", expr_data=exprData1,
+   fit_options=fitOpts,
+   gene_sets_list=list(myGeneSets1=myGSs1, myGeneSets2=myGSs2));
> igsaInput2 <- IGSAinput(name="igsaInput2", expr_data=exprData2,
+   fit_options=fitOpts,
+   gene_sets_list=list(myGeneSets1=myGSs1, myGeneSets2=myGSs2));
> experiments <- list(igsaInput1, igsaInput2);
> ## And then simply run MIGSA
> migsasRes <- MIGSA(experiments);

```

6. MIGSA's utility

In this section we are going to demonstrate **MIGSA**'s utility by analyzing several well known breast cancer datasets. For each dataset, subjects were classified into breast cancer intrinsic subtypes (Basal-Like, Her2-Enriched, Luminal B, Luminal A and Normal-Like) using the PAM50 algorithm (Parker *et al.* 2009) by means of the **pbmc** R library (Fresno *et al.* 2016) and processed as suggested by Sorlie *et al.* (Sørlie *et al.* 2010). Only those subjects classified as Basal-Like or Luminal A were included.

Enrichment was tested over 20,245 Gene Ontology gene sets (14,291 biological processes, 1,692 cellular components and 4,263 molecular functions), and 179 from KEGG.

6.1. Used datasets

A total of eight datasets were tested, six of them were loaded by means of the **pbmc** R library, i.e., Mainz, Nki, Transbig, Unt, Upp and Vdx); and two were downloaded from the TCGA repository, i.e., microarray and RNAseq data matrices. For each dataset, genes reliably detected in less than 30% of the samples per condition were removed from the analysis. In addition, in RNAseq data, genes with a mean less than 15 counts per condition were also removed. Detailed datasets information can be seen in Table 2.

Table 2: Datasets details

Dataset	Platform	Subjects		Genes
		Basal	Luminal A	
Mainz	Microarray	18	117	13,091
Nki	Microarray	66	100	12,975
TCGA	Microarray	95	142	16,207
TCGA	RNAseq	95	142	16,741
Transbig	Microarray	37	89	13,091
Unt	Microarray	22	42	18,528
Upp	Microarray	19	150	18,528
Vdx	Microarray	80	134	13,091
Total	-	432	916	-

6.2. MIGSA on TCGA data

Let's run MIGSA over the TCGA RNAseq and microarray datasets. We are going to load both datasets using the **MIGSAdata** package, please refer to the gettingTcgaData vignette for details about these matrices.

NOTE: This chunk of code took 29.83m to execute on 10 cores.

```
> library(edgeR);

6.3. MIGSA on pbcmc datasets

Let's run *MIGSA* over the pbcmc microarray datasets. We are going to load six datasets using the **MIGSAdata** package, please refer to the gettingPbcmcData vignette for details on how we got this matrices.

NOTE: This chunk of code took 1.27 hours to execute on 10 cores.

```

> library(limma);
> library(MIGSA);
> library(MIGSAdata);
> data(pbcmcData);
> ## with these treat log fold change values we will get around 5% of
> ## differentially expressed genes for each experiment
> treatLfcs <- c(0.7, 0.2, 0.6, 0.25, 0.4, 0.75);
> names(treatLfcs) <- c("mainz", "nki", "transbig", "unt", "upp", "vdx");
> experiments <- lapply(names(treatLfcs), function(actName) {
+   actData <- pbcmcData[[actName]];
+   actExprs <- actData$geneExpr;

```

```

+   actSubtypes <- actData$subtypes;
+
+   # filtrate genes with less than 30% per condition
+   actExprs <- actExprs[
+     rowSums(is.na(actExprs[, actSubtypes == "Basal" ])) <
+       .3*sum(actSubtypes == "Basal") &
+     rowSums(is.na(actExprs[, actSubtypes == "LumA" ])) <
+       .3*sum(actSubtypes == "LumA")
+   , ]
+
+   # create our IGSAinput object
+   actExprData <- new("MAMList", list(M=actExprs));
+   actFitOpts <- FitOptions(actSubtypes);
+   actIgsaInput <- IGSAinput(
+     name=actName,
+     expr_data=actExprData,
+     fit_options=actFitOpts,
+     sea_params=SEAprams(treat_lfc=treatLfcs[[actName]]));
+   return(actIgsaInput);
+ })
+
>
> ## Not run:
>
> gSets <- list(
+   KEGG=downloadEnrichrGeneSets("KEGG_2015")[[1]],
+   BP=loadGo("BP"),
+   CC=loadGo("CC"),
+   MF=loadGo("MF"));
> set.seed(8818);
> pbcmcMigsAres <- MIGSA(experiments, geneSets=gSets);
>
> ## Time difference of 1.26684 hours in 10 cores
> ## End(Not run)

```

6.4. MIGSA exploring breast cancer enrichment results

Let's start with the exploratory task. First, merge both MIGSAres objects into one with all the datasets results.

NOTE: In order to follow this code, sections 6.2 and 6.3 must have been executed. If not, jump to the next “End(Not run)” tag.

```

> ## Not run:
>
> dim(pbcmcMigsAres);
> # [1] 20425      9

```

```

> dim(tcgaMigsasRes);
> # [1] 20425      5
>
> ## Let's merge both results in one big MIGSAres object
> bcMigsasRes <- merge(pbcMigsasRes, tcgaMigsasRes);
> dim(bcMigsasRes);
> # [1] 20425     11
> ## End(Not run)

> ## As last chunk of code was not executed, we load that data:
> library(MIGSA);
> library(MIGSAdata);
> data(bcMigsasResAsList);
> bcMigsasRes <- MIGSA::MIGSAres.data.table(bcMigsasResAsList$dframe,
+ bcMigsasResAsList$genesRank);
> rm(bcMigsasResAsList);
> ## End>Loading data)
>

123872	123872	14
6422	6422	13
388389	388389	13
55036	55036	13
2099	2099	13

```
> ## Gene 652 is contributing to enrichment in 15 gene sets. And in total
> ## there are 6 genes that are being really active in TCGA enriched
> ## gene sets
> tcgaImportantGenes <- as.character(mostEnrichedGenes$data$id);
```

```
> ## Let's do the same analysis for the rest of the datasets, so we can filtrate
> ## which genes are acting exclusively in TCGA datasets
> consMostEnrichedGenes <- genesBarplot(consensusGsets, gsFilter=53.25);
```

```
> consImportantGenes <- as.character(consMostEnrichedGenes$data$id);
> ## Let's see which genes they share
> intersect(tcgaImportantGenes, consImportantGenes);

[1] "652"

> ## And get the really tcga exclusive genes (5 genes)
> tcgaExclGenes <- setdiff(tcgaImportantGenes, consImportantGenes);
```

Another way of exploring the data is for example, suppose we have a list of genes of interest, we can filter our results having the gene sets that were enriched by our interest genes as follows:

```
> ## Let's sample 4 genes from consImportantGenes (as if they are our interest
> ## genes)
> set.seed(8818);
> myInterestGenes <- sample(consImportantGenes, 4);
> ## So we can get the filtered MIGSAres object by doing:
> intGenesMigsa <- filterByGenes(bcMigsaRes, myInterestGenes);
> dim(intGenesMigsa);
```

```
[1] 341 11
```

```
> head(intGenesMigsA);
```

	id	Name	GS_Name	mainz	nki
40	GO:0000070	mitotic sister chromatid segregation	BP	TRUE	TRUE
41	GO:0000075	cell cycle checkpoint	BP	TRUE	TRUE
47	GO:0000086	G2/M transition of mitotic cell cycle	BP	TRUE	TRUE
69	GO:0000132	establishment of mitotic spindle orientation	BP	TRUE	TRUE
87	GO:0000166	nucleotide binding	MF	FALSE	FALSE
116	GO:0000226	microtubule cytoskeleton organization	BP	TRUE	TRUE

	tcgaMA	tcgaRNA	transbig	unt	upp	vdx
40	TRUE	TRUE	TRUE	TRUE	TRUE	TRUE
41	TRUE	FALSE	TRUE	TRUE	TRUE	TRUE
47	TRUE	TRUE	TRUE	TRUE	TRUE	TRUE
69	TRUE	TRUE	TRUE	FALSE	TRUE	TRUE
87	FALSE	FALSE	FALSE	TRUE	TRUE	FALSE
116	TRUE	TRUE	TRUE	TRUE	TRUE	TRUE

And with this new MIGSAres object reproduce the same analysis done below.
